

95 FAWCETT STREET
Cambridge, Massachusetts

Transportation Impact Study

Prepared For:
KEMS Corporation

Prepared by:
Design Consultants, Inc.

October 2015

EXECUTIVE SUMMARY

This Transportation Impact Study (TIS) was prepared to analyze the impact of the proposed residential building at 95 Fawcett Street in the Alewife Overlay District (AOD) in Cambridge, Massachusetts, on surrounding traffic operations. Currently, the site has a 20,522 square foot (SF), one-floor storage warehouse. The proposed project will involve tearing down the warehouse to construct a new five-floor residential building. The new building will consist of 2 residential studios, 34 1-bedroom residential units, and 14 2-bedroom residential units. There will be 25 vehicle parking spaces on the ground floor garage and 23 parking spaces on the basement floor garage for the residences. The project will also provide 1,583 SF of bicycle parking and a bike repair area on the ground floor. There will be one basement ramp at the front of the building which will provide access to Fawcett Street, and there will be a side entry to access bicycle parking.

Land use surrounding the site is mixed, including residential buildings, commercial office buildings, and light industrial use. There are two new residential buildings located on the opposite side of Fawcett Street of the project site. Commercial offices and light industrial spaces are located along the east-west segment of Fawcett Street. The Fresh Pond Mall is located about 0.5 miles east of the site. It includes various retail and grocery stores such as Whole Foods Market and Trader Joe's. The project site will have access to Concord Avenue and Route 2 for commutes to Cambridge and Boston via Fawcett Street.

Analyses of 2015 Existing, 2015 Build, and 2020 Future traffic conditions were carried out to assess the impact that the new development at 95 Fawcett Street will have on local operations. Parking analyses, transit analyses, and pedestrian/bicycle analyses was also carried out to determine the influence of the proposed project on multi-modal transportation. Given the results of these analyses, a Transportation Demand Management (TDM) program was recommended to minimize possible adverse impact to the surrounding traffic network.

Study Area

The following three intersections in Cambridge, Massachusetts were analyzed as part of this traffic study:

- Concord Avenue at Fawcett Street
- Concord Avenue at Moulton Street
- Fawcett Street at Spur Road

Each of the study intersections above is highlighted relative to the project site in Figure 1.b.1. See Section B for detailed descriptions of existing conditions.

Traffic Analysis

For each intersection, capacity analyses were carried out under three scenarios: Existing Conditions, Build Condition in year 2015, and Future Condition in year 2020. Each scenario is explained in the report. The City of Cambridge Guidelines for Transportation Impact Study (TIS) require a 5-year planning horizon. The Existing Conditions analysis is based on recent traffic counts carried out in the study area. The Build scenario takes the predicted site specific traffic

volumes and sums them with the Existing Conditions scenario. The Future Condition scenario analyzes the Build Condition volumes plus any background traffic volumes generated by nearby developments. Additionally, these volumes are increased by a one half percent annual growth rate through the year 2020 to arrive at the final Future Condition volumes. Detailed breakdowns of each of these scenarios is included in Section 5 of this report.

Level of Service (LOS) is a term used to qualitatively measure the performance of traffic conditions at each intersection and is explained further in the body of this study.

A comparison table showing the results of these analyses is shown below in Table A.

Table A: LOS Summary

ID	East-West Road	North-South Road	Lane	Existing (2015)		Build (2015)		Future (2020)	
				AM	PM	AM	PM	AM	PM

Transportation Demand Management

The proponent has agreed to put a Transportation Demand Management program in place to encourage alternative transportation modes and reduce site-generated automobile trips. The goal of the program is to encourage carpooling, bicycle commuting, walking and use of public transit.

The Transportation Demand Management (TDM) Plan consists of contacting a car-sharing provider (e.g. Zipcar) for possible, and providing at least one car-sharing space in the garage for the residents.

Other proposed mitigation could include improving pedestrian and bicycling facilities in the area, such as installing pedestrian wayfinding signage near the site. The proponent has also included a bicycle repair area for repairs and maintenance for residents of the building. Other potential

mitigation measures could include joining a local Transportation Management Association (TMA) and providing shuttles between the MBTA Alewife Station and the site.

Conclusion

This Transportation Impact Study (TIS) was prepared to analyze the traffic impact of the 95 Fawcett Street residential project. Currently there is a 20,522 square-foot, one floor storage warehouse on site, the proposed project consists of the construction of one new building that will house 50 residential units.

From a safety perspective, there are no significant issues in the existing conditions for the included study intersections. An analysis of the most recent three years of crash data from MassDOT shows that one of the three intersections included in the study area has a crash rate above the state or district wide average, though it should be noted that this rate is skewed by very low hourly volumes, and that there were no reported injury crashes at the location. See Section 2.d for more detailed safety analyses.

Capacity analyses were carried out on the three study intersections for the weekday AM and weekday PM peak hour periods. In order to determine the specific impact the proposed project will have on traffic operations, analysis was carried out for 2015 Existing conditions, 2015 Build conditions, and 2020 Future conditions. The results indicate that the development will have minimal adverse impact on traffic operations in the study area.

The project was evaluated against the City of Cambridge Planning Board Criteria to determine if the project will have any significant impacts to the City's transportation network. All five of the criteria are met with one exception. The Pedestrian Level-of-Service (PLOS) at Concord Avenue and Fawcett Street operates at F during Existing and Build conditions. However, this is an existing condition that continues into the future condition. Moreover, there is a pedestrian-actuated flashing beacon that facilitates pedestrian movements across Concord Street, which is not reflected in the PLOS. So although in theory the PLOS is F, the reality is that PLOS is effectively much higher due to the beacon facilitating pedestrian movements across Concord Street. Also, the proponent is committed to working with the City of Cambridge to implement appropriate measures to mitigate existing deficiencies within the scope of its project. A more detailed evaluation of the project in terms of the Planning Board criteria is included in Section 13 of this report.

Introduction

On July 20, 2015, DCI submitted a TIS scoping letter to the City of Cambridge for the proposed project located at 95 Fawcett Street in the Alewife Overlay District (AOD) in Cambridge, Massachusetts. DCI coordinated with the Cambridge Traffic, Parking, and Transportation Department (TP&T) and confirmed the Traffic Impact Study scope on August 10, 2015. A copy of the City's scoping letter is attached in the Appendix. The study analyzed the impact of the proposed residential building on surrounding traffic operations. The study was completed in October 2015.

Project Description

The proposed residential project will demolish an existing 20,522 square foot one-floor warehouse, which is currently being used as a furniture store. The estimated total square footage of the new five floor building will be 79,853 square feet. It will accommodate 50 residential units supported by 48 parking spaces. There will be 25 parking spaces in a ground level garage and 23 parking spaces on the basement level parking garage. A curb cut is proposed to be located at the north side of the building, providing access to Fawcett Street from the ground level garage. As requested in the scoping letter, DCI performed a sight distance analysis for three different locations for the proposed curb cut. The sight distance analysis is shown in Figure D. With input from TP&T, it was decided that option B will be the final location for the curb cut. The basement level parking will be accessed from inside of the building through a parking elevator. Pedestrians will be able to access the site from the existing sidewalks along Fawcett Street. The project will also provide 1,583 square feet of secure space for bicycle parking. An existing conditions plan is shown in Figure A, project site plans are shown in Figures B1 and B2, and a bicycle parking layout plan is shown in Figure C.

Activities other than the daily comings and goings of residents were also noted, such as weekly trash pickup and move-in/move-out activity. The developer will provide weekly curbside pickup of trash for the residents of 95 Fawcett Street by a private contractor. As a residential building, the logistics of residents moving in and out of 95 Fawcett Street was addressed. The on-site parking garage will be sized so that large vans and small trucks will be able to pull in, park and unload without blocking traffic or taking up space along Fawcett Street. The garage will have a maximum height of 9 feet, allowing vehicles shorter than that to pull in. There will also be sufficient space for these smaller moving vehicles to turn around to exit the garage. Additionally, the aisle in the garage will be designed for two-way traffic. Residents utilizing larger vehicles such as box trucks and 18 wheelers will need to obtain a moving van permit from the City of Cambridge prior to moving in in order to use on street parking spaces for loading and unloading. The developer will be responsible for informing residents of this process. Based on research and discussions with the architect, it was determined that the national average turnover rate for rental condominium units is roughly 30-40% annually. Therefore, it is expected that after the initial move in process it there will be 15-20 units of turnover per year.

2005 Concord-Alewife Plan

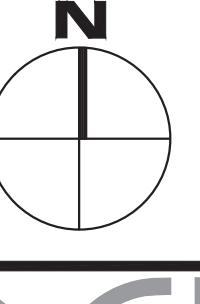

In November, 2005, the City of Cambridge released the Concord-Alewife Plan. This plan addresses issues in the area including appropriate mix of land uses, the character of future development, as well as traffic and access. The plan lays out goals for each issue, as well as zoning changes needed to accomplish these goals. The proposed project at 95 Fawcett Street will be consistent with the Concord-Alewife Plan, as the proponent will be making efforts to improve pedestrian and bicycle mobility, reduce traffic congestion, and minimize the need for vehicle parking.

Major transportation goals of the Concord-Alewife Plan focus on reducing the number of new vehicle trips into and out of the area while still encouraging development. The proponent at 95 Fawcett Street will make use of several transportation demand management (TDM) measures that will support the goal of a reduced vehicular mode share. The proposed TDM program is discussed in Section 14.

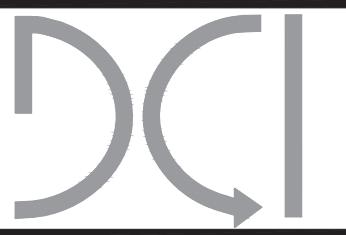

There is an abundance of bicycling infrastructure within riding distance of the project site, including a cycle track along Concord Avenue that connects to a mixed use path which eventually provides connections to the Paul Dudley White Bike Path along the Charles River. The Alewife Linear Park is a mixed use path connecting the Fitchburg Cutoff Bike Path to the Somerville Community Path, and can be accessed just one mile north of the project site. With these facilities nearby, the development at 95 Fawcett Street is perfectly located for an anticipated higher non-vehicular mode split. The aforementioned paths are also used by pedestrians. Ensuring that there are safe, comfortable connections into and out of the project area will increase connectivity for pedestrians and encourage people to walk, ride bicycles, and take public transit.

Pedestrian/Bicycle Bridge

As part of the ongoing development in the area, the City of Cambridge is considering to construct a pedestrian and bicycle bridge across the train tracks north of the project area. This bridge would provide much needed non-motorized access for the residents in Alewife Overlay District to the MBTA Alewife Station. The City has started a feasibility study of the proposed bicycle and pedestrian bridge and commuter rail station. The location of the development at 95 Fawcett Street is not likely to impact the landing of the bridge or the proposed crosswalk. However, the bridge landing is likely to be close enough to 95 Fawcett Street to give convenient access for residents of 95 Fawcett Street to the Alewife Station. Indeed, the TDM section of this study recommends the proponent consider assisting with the bridge project.

1. Existing Conditions

a. Roadways

Fawcett Street is classified as a local street in Cambridge, Massachusetts. It travels in a generally north-south direction from its intersection with Concord Avenue to the project site, after which it curves east-west from the site to its intersection with Smith Place. Fawcett Street is approximately 0.5 miles long and carries one travel lane in either direction. Along the north-south segment, Fawcett Street has designated on-street parallel parking spaces on the east side of the street. Parking is not allowed on the west side of the street. Along the east-west segment, Fawcett Street provides on-street parallel parking spaces on the south side and north side of the street. The curb-to-curb distance ranges from 30 to 35 feet. Two-way traffic is separated by a solid double yellow line along the north-south segment.

Concord Avenue is classified as an urban principal arterial and runs in a generally northwest-southeast direction. It connects Spring Street in Lexington to Waterhouse Street in Cambridge, which eventually accesses Massachusetts Avenue in Cambridge. It spans approximately 7.6 miles and carries one 8-foot travel lane and one 9-foot travel lane in the eastbound direction, one 9-foot travel lane in the westbound direction, and one 5-foot cycletrack in each direction in the vicinity of the study area. The curb to curb distance is 32 feet. A solid double yellow line separates opposing directions of traffic. On-street parking is prohibited along both sides of the street. A yield-to-pedestrian sign and a pedestrian warning sign have been installed at Concord Avenue's intersection with Fawcett Street alerting motorists where the pedestrians may cross the street. At this intersection a row of yield markings (a.k.a. "shark teeth") has been painted facing oncoming traffic to alert drivers of the pedestrian crossing. In the area of the project, a 7-foot concrete sidewalk is provided on both sides of the street.

Moulton Street is classified as a local street in Cambridge. It travels in a generally south-north direction from its intersection with Concord Avenue, to its intersection with Wilson Road, where it becomes Wilson Road. Moulton Street is approximately 830 feet long. On-street parking is allowed on the east side of street, starting from approximately 360 feet away from the intersection with Concord Avenue to the end of the street. On-street parking is prohibited on the west side of the street. The curb-to-curb distance is 26 feet. Moulton Street provides a 6-foot sidewalk on the east side of the street and a 5-foot sidewalk on the west side of the street.

b. Intersections

The project study area includes the following three intersections. The study intersections are shown relative to the project site in Figures 1.b.1 to 1.b.3.

The intersection of **Fawcett Street and Concord Avenue** is an unsignalized, three-legged T-intersection. Fawcett Street runs south-north, and Concord Avenue runs east-west. Concord Avenue's eastbound approach carries two travel lanes, while its westbound approach carries one travel lane. Fawcett Street carries one lane in each direction. Continental crosswalks are placed across the Concord Avenue eastbound approach and the Fawcett Street southbound approach to the intersection. See Figure 1.b.1 for a layout of the intersection of Fawcett Street and Concord Avenue.

The intersection of **Moulton Street, Concord Avenue and the driveway of Neville Place at Fresh Pond** forms an offset four-legged intersection controlled by a traffic signal. Neville Place offers local seniors personalized assisted living. The southbound approach on Moulton Street carries one travel lane. The driveway of The Neville Place at Fresh Pond's provides one approaching lane and one receiving lane. The Concord Avenue eastbound approach provides two travel lanes, and its westbound approach provides one travel lane. Continental crosswalks are placed across the Moulton Street approach, Neville Place driveway approach, and Concord Avenue westbound approach. See Figure 1.b.2 for a layout of the intersection of Moulton Street, Concord Avenue and the Neville Place Driveway.

The intersection of **Fawcett Street and Spur Road** is an unsignalized intersection. Spur Road carries one travel lane in each direction. It provides a 4.5 foot shoulder on each side of the street, which could accommodate bicycles. The curb to curb distance along Spur Road is 29 feet. Two continental crosswalks are placed at the intersection; one is placed crossing Spur Road and the other provides a crossing over Fawcett Street's northbound approach. See Figure 1.b.3 for a layout of the intersection of Fawcett Street and Spur Road.

c. Parking

The existing site has a curb cut located on the northern end of the storage warehouse providing access to a surface lot that accommodates vehicle parking. The parking spaces are not striped. There is off-site parking along Fawcett Street. See Figure 1.c.1 for existing on-street curb regulations in the study area.

d. Transit Services

Within the vicinity of the project, MBTA bus lines 74, 75, and 78 run through the area. There is also an MBTA Red Line station at Alewife and an MBTA Commuter Rail station at Belmont.

MBTA bus routes 74 and 75 run between Belmont Center and Harvard Station along Concord Avenue. These routes provide access to the MBTA Red Line, which runs from Alewife through

downtown Boston to Dorchester and Quincy. Route 74 travels the northern edge of Fresh Pond along Concord Avenue, while Route 75 travels the southern edge of Fresh Pond via Huron Avenue. Both Routes run at 30 minute to one hour and 10 minute intervals.

MBTA Route 78 runs from Arlmont Village to Harvard Station. Arlmont Village is the area bordered by Arlington, Belmont, and Lexington. In the vicinity of the study area, Route 78 runs along Concord Avenue. Route 78 runs at 20 minute to hourly intervals. Route 78 also provides access to the MBTA Red Line, giving travelers in the project area three options for bus connections to the Red Line.

Alewife Station is approximately one mile northwest of the project site. Alewife Station is the northernmost stop on the MBTA Red Line. From Alewife, the Red Line travels through Somerville, Cambridge, downtown Boston, south Boston, Dorchester and Quincy. The Red Line runs at 9 to 16 minute intervals.

Belmont Station is on the Fitchburg line of the MBTA Commuter Rail. This line runs between Fitchburg and downtown Boston. The Fitchburg line runs approximately twice an hour during the AM and PM peak hours, with trains running at various times between those peak periods. Figure 1.d.1 illustrates existing MBTA services in the study area.

e. Land Use

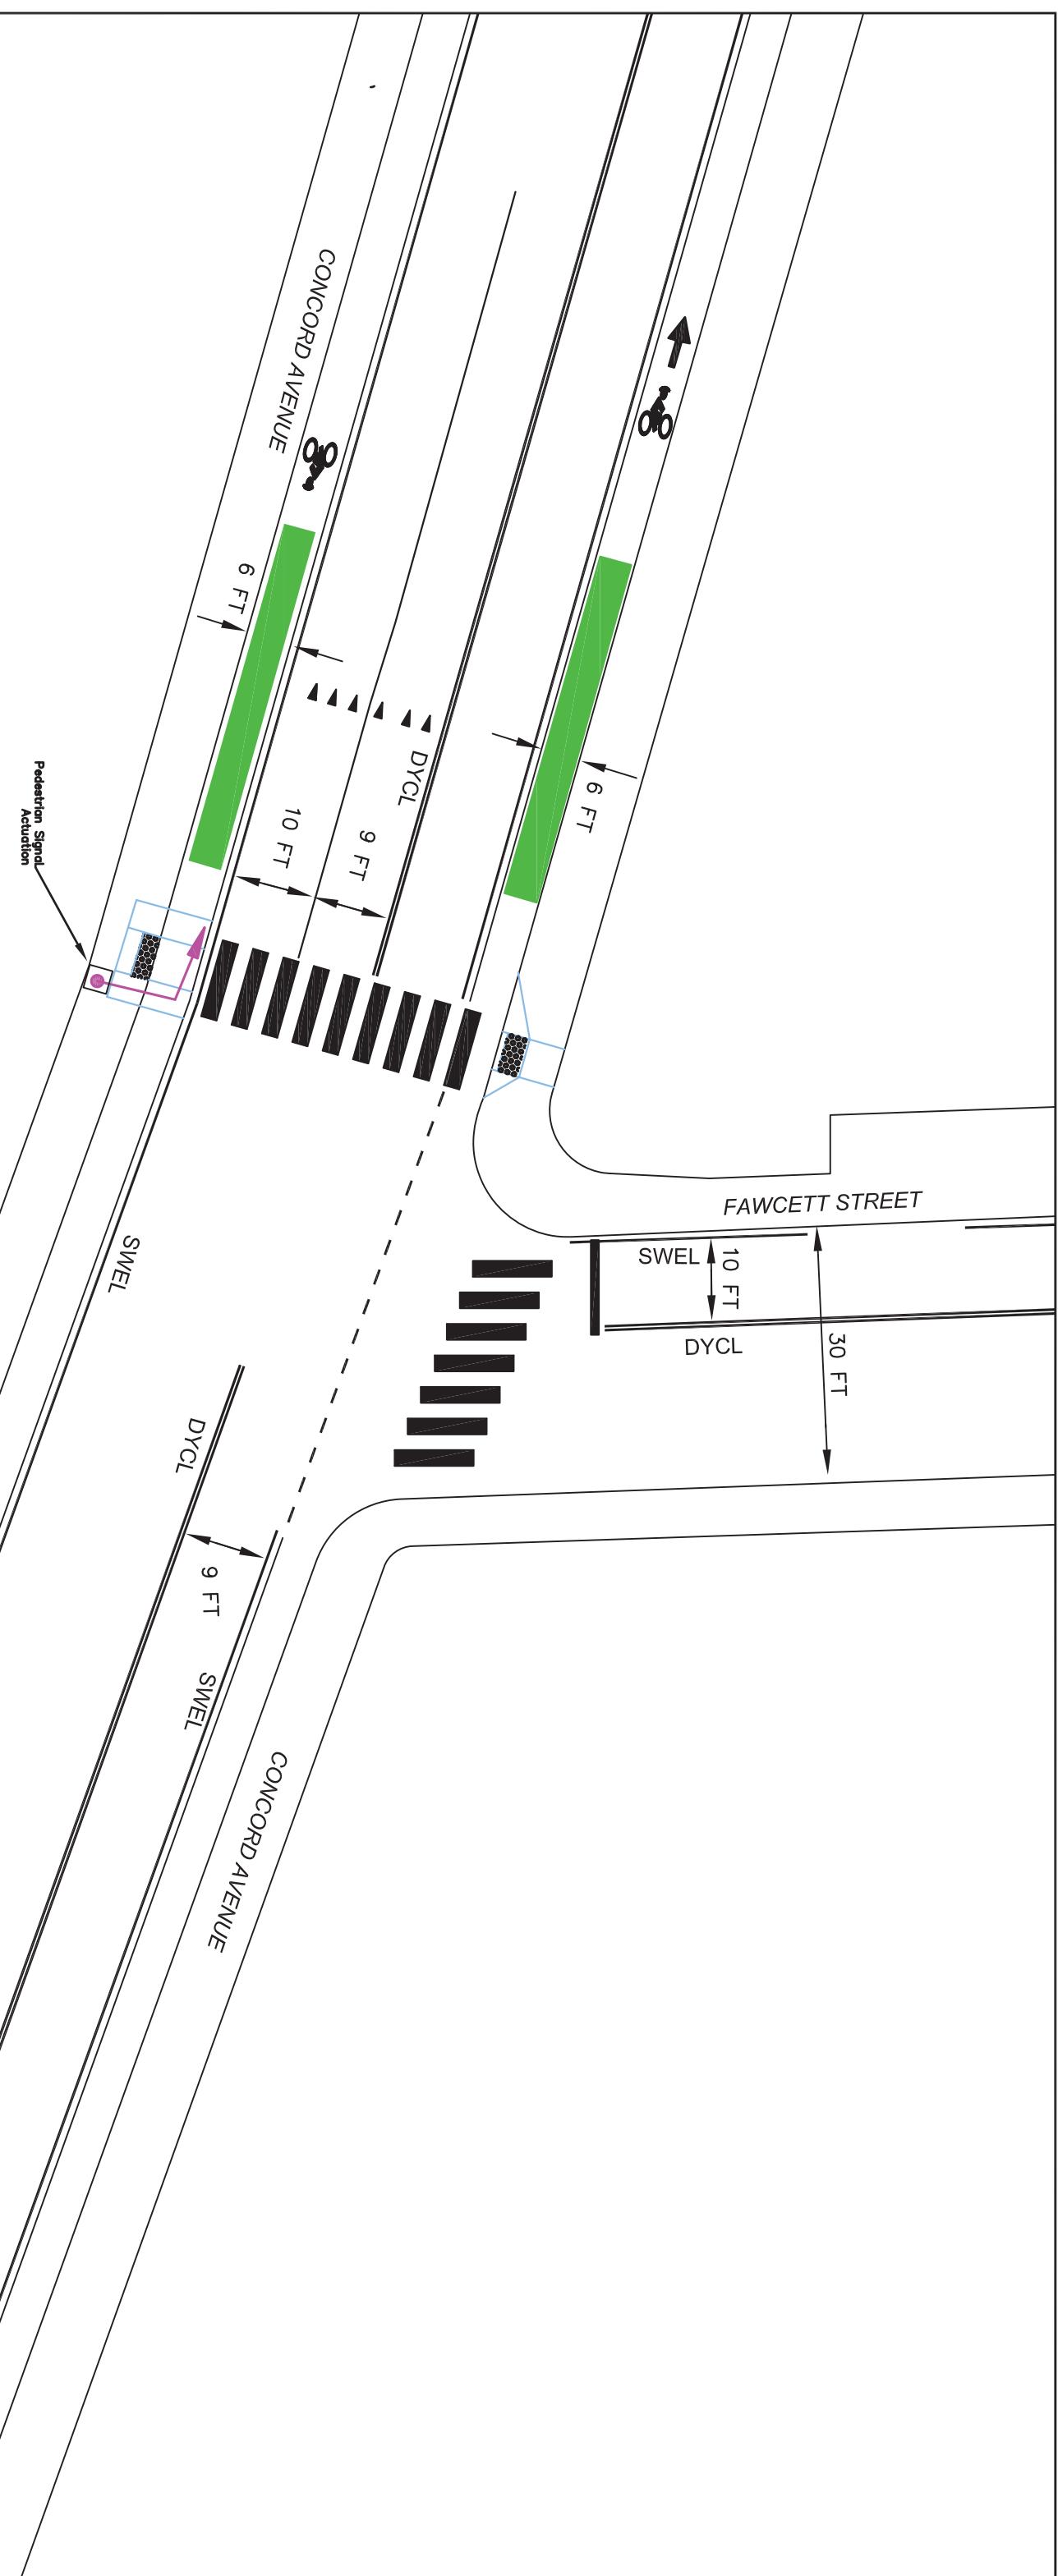

The proposed project is in the Alewife Overlay District of Cambridge. Land use surrounding the site is mixed. In the immediate project area, there are several residential buildings, as well as commercial office space and light industrial use. On Fawcett Street, there are two new residential buildings, both opposite the project site. Commercial offices and light industrial spaces are located further down Fawcett Street, along its east-west segment. There is significant recreational space in the area, with Fresh Pond just south of the site, as well as several nearby parks, including Lusitania Field, Danehy Park, and Callanan Playground. There are two schools in the area, including Tobin Elementary School southeast of the site and the Fayerweather Street School west of the site. The Fresh Pond Mall is located about 0.5 miles east of the Site, housing various retail stores and grocery stores such as Whole Foods Market and Trader Joe's. See Figure 1.e.1 for a layout of the land uses surrounding the project site.

PROJECT NO.
2015-009

DATE: OCTOBER 2015

Figure 1.e.1

2. Data Collection

a. Automatic Traffic Recorder (ATR) Counts

Automatic traffic recorder (ATR) data was taken in two locations in the vicinity of the project area. These ATR collected data including traffic volumes, vehicle speeds, vehicle classification and gaps between vehicles. An ATR was placed on Concord Avenue just east of Fawcett Street, and on Fawcett Street just north of the site at 95 Fawcett Street. ATR data were collected over a 48-hour period on a typical Wednesday (September 9, 2015) and Thursday (September 10, 2015). The ATR data are summarized in Table 2.a.1.

Table 2.a.1: Existing Traffic Volume Summary

Location	AADT	Weekday AM Peak Hour			Weekday PM Peak Hour		
		Volume	K	Peak Direction	Volume	K	Peak Direction
Fawcett Street south of 95 Fawcett Street	2731	248	9%	55% NB	230	8%	60% NB
Concord Avenue east of Fawcett Street	10885	1591	15%	53% WB	1612	15%	53% WB

b. Pedestrian and bicycle counts

Pedestrian and bicycle counts were carried out at the same locations as the ATR. These studies count cyclists traveling in both directions, as well as pedestrians on either side of the road. This data is summarized in Table 2.b.1.

Table 2.b.1: Pedestrian and Bicycle Count Summary

	Fawcett Street				Concord Avenue			
	Bikes		Pedestrians		Bikes		Pedestrians	
	Northbound	Southbound	Northbound	Southbound	Eastbound	Westbound	Eastbound	Westbound
6:30AM - 7:30AM	0	2	5	31	21	9	33	37
7:30AM - 8:30AM	1	4	16	34	38	28	40	45
8:30AM - 9:30AM	1	2	10	20	21	37	41	62
9:30AM - 10:30AM	0	2	10	7	20	12	29	27
10:30AM - 11:30AM	1	2	5	13	10	11	36	30
11:30AM - 12:30PM	0	0	23	28	10	14	45	53
12:30PM - 1:30PM	0	1	16	13	11	12	18	42
1:30PM - 2:30PM	2	1	15	11	10	8	21	22
2:30PM - 3:30PM	4	3	19	19	7	14	24	38
3:30PM - 4:30PM	0	1	19	14	12	9	37	22
4:30PM - 5:30PM	4	4	17	25	31	22	51	51
5:30PM - 6:30PM	4	1	23	20	19	47	50	48

c. Intersection Turning Movement Counts (TMC's)

In September, 2015, DCI collected traffic counts at five intersections. DCI collected the data on a typical Wednesday (September 9, 2015) for two hours during the AM peak period and two hours during the PM peak period. Data was collected from 7:00AM to 9:00AM and from 4:00PM to 6:00PM. TMCs were collected at the intersections listed below.

- Concord Avenue at Fawcett Street
- Concord Avenue at Moulton Street
- Fawcett Street at Smith Place
- Fawcett Street at Spur Road (between 80 Fawcett Street and 90 Fawcett Street)
- In/out driveway counts at parking garages for 80 Fawcett Street and 90 Fawcett Street

Figures 2.c.1 and 2.c.2 show existing vehicle volumes for the AM and PM peak hours, respectively. Figures 2.c.3 and 2.c.4 show existing pedestrian volumes for the AM and PM peak hours, respectively. Figures 2.c.5 and 2.c.6 show existing bicycle volumes for the AM and PM peak hours, respectively.

d. Traffic Crashes

Crash data from MassDOT for years 2011 through 2013 was reviewed for crashes that occurred at the project site. The MassDOT crash records offered the following information:

- Crash Location (General or Specific) / Direction of vehicle(s)
- Date / Time
- Roadway surface conditions / Light conditions / Weather conditions
- Crash Severity / Manner of Collision

While it may be assumed that all relevant crash attributes should be reported and provided in recordkeeping, the fact of the matter is that a portion of the individual crash records have only partial information available. Information may be missing for a variety of data fields in any given crash report. Among various reasons for this, missing crash information might be attributed to the type of police reports filled out and provided to MassDOT.

The locations of crashes in the area of the study intersections were general and approximated in a relatively large number of cases. This lack of specificity can hinder the engineer's ability to identify statistically significant trends and diagnose potential safety problems.

With that said, the synthesized data, in conjunction with engineering judgment, has yielded a summary of crashes that may be used to speculate on a variety of general crash patterns.

The results of the safety analysis carried out using MassDOT data are shown in Tables 2.d.1 and 2.d.2. The crash rates calculated using these data are compared to average District 6 and statewide

crash rates are shown in Table 2.d.3. Detailed crash analysis worksheets for each intersection for years 2010-2012 are contained in Appendix B.

Table 2.d.3: MassDOT Intersection Crash Rates

	<i>Avg. Crashes per Year</i>	<i>Avg. Crash Rate (Crashes per MEV)</i>	<i>MassDOT D6 Avg. Crash Rate (Crashes per MEV)</i>	<i>Statewide Avg. Crash Rate (Crashes per MEV)</i>
<i>Moulton Street & Concord Ave</i>	4.00	0.61	0.76	0.80
<i>Fawcett Street & Smith Place</i>	0.67	0.80	0.58	0.60
<i>Fawcett Street & Concord Avenue</i>	2.67	0.34	0.58	0.60

The intersection of **Moulton Street and Concord Avenue** had 12 crashes between 2011 and 2013 according to MassDOT crash records. Approximately 42% of the known crashes resulted in property damage only, while 42% resulted in non-fatal injury. 58% of the crashes at this intersection were rear-end collisions. Two of the crashes at this intersection involved a pedestrian, one of which resulted in a non-fatal injury. Over the three year period analyzed, the intersection of Moulton Street and Concord Avenue had an average of four crashes per year, and 0.61 crashes per million entering vehicles (MEV). This is below the District 6 and statewide average crash rates for signalized intersections.

The intersection of **Fawcett Street and Smith Place** had 2 crashes between 2011 and 2013 according to MassDOT crash records. There were no recorded crashes at this intersection involving pedestrians or cyclists. These crashes result in an average of 0.67 crashes per year, and an average crash rate of 0.80 crashes per MEV, which is above the statewide and District 6 averages for unsignalized intersections. While this crash rate is higher than average, it should be

noted that this rate is somewhat skewed by extremely low traffic volumes (less than 50 vehicles per hour during the peak hour). Moreover, the intersection experienced no reported injury crashes.

The intersection of **Fawcett Street and Concord Avenue** had 8 crashes between 2011 and 2013 according to MassDOT crash records. Records show that 50% of the known crashes at this intersection resulted in property damage only, while 25% resulted in non-fatal injury. There were no recorded crashes at this intersection involving pedestrians or cyclists. The eight crashes at the intersection of Fawcett Street and Concord Avenue resulted in an average of 2.67 crashes per year, and 0.34 crashes per MEV, which is below both the statewide and District 6 averages for unsignalized intersections.

Based on the safety analysis carried out based on MassDOT crash data from 2011 to 2013, it was determined one of the study intersections, Fawcett Street and Smith Place, has a crash rate above the statewide and District 6 averages. However, the crash rate for this intersection is skewed by very low volumes. Given this, it can be said that existing conditions and roadway geometries within the project area do not show any significant safety issues that need to be addressed as part of this traffic study.

e. Public Transit

The MBTA services the study area with the Red Line at Alewife Station, as well as bus routes 74, 75, and 78. See Tables 2.e.1 to 2.e.3 for summaries of these bus and subway schedules.

The details of transit schedules and headways for each of these services are included in Appendix C. The most recent boarding and alighting information was obtained from the MBTA for the Red Line service, and bus route 74 and 78. The two bus routes provide service along Concord Avenue near the site with a combined peak hour headway of 10 minutes. Table 2.e.1 summarizes the schedules and headways for bus routes 74 and 78, and the Red Line.

Table 2.e.1: Existing Bus and Subway Service Schedules and Headways

	Origin/Destination	Hours of Operation(weekday)	Hours of Operation (Saturday)	Headway (rush hour)	Headway (off peak hour)
Route 74	Belmont Center/Harvard Station	5:20AM – 1:10 AM	5:35AM – 1:20 AM	20 minutes	40 minutes
Route 78	Arlmont Village/Harvard Station	5:42AM – 12:30 AM	6:32AM – 12:40 AM	25 minutes	35 minutes
Red Line	Alewife/Ashmont-Braintree	5:16AM – 12:30 AM	5:15AM – 1:49AM	9 minutes	12-14 minutes

Bus boarding and alighting volumes were obtained for all bus stops on Concord Avenue from the MBTA. The data for the bus stops at Fawcett Street and Moulton Street are summarized in Table 2.e.2. The data for the Red Line service was more limited in nature, and only available for daily

entries at Alewife Station. The data indicated that 11,221 entries are made at Alewife Station over the course of a typical weekday.

Table 2.e.2: Existing Route 74 and 78 Bus Route Data

Inbound	Route	# of Buses	Moulton St	Fawcett St
Boarding	74	37	23	4
	78	47	17	2
	Total	84	40	6
Alighting	74	37	1	1
	78	47	1	1
	Total	84	2	2

Boarding	74	32	0	0
	78	44	0	0
	Total	76	0	0
Alighting	74	32	1	15
	78	44	9	25
	Total	76	10	40

Source: MBTA Ridership

f. Parking

A parking utilization study was carried out along Fawcett Street from Concord Avenue to Smith Place. The study was done on a typical weekday from 1:00PM to 3:00PM and from 10:00PM to 11:00PM. It was observed that during the afternoon period, an average of 58 out of 68 available parking spots were occupied. This represents an average of 85% of parking spaces being occupied during the afternoon period. At the observed peak accumulation of vehicles during the afternoon period, 89% of available street parking spaces were occupied. During the evening period of 10:00PM to 11:00PM, an average of 47 out of 68 available parking spaces were occupied. This represents an average of 68% occupation for the on-street parking. At the observed peak accumulation of vehicles during the evening period, 68% of available street parking spaces were occupied. Complete parking utilization study data is included in Table 2.f.1.

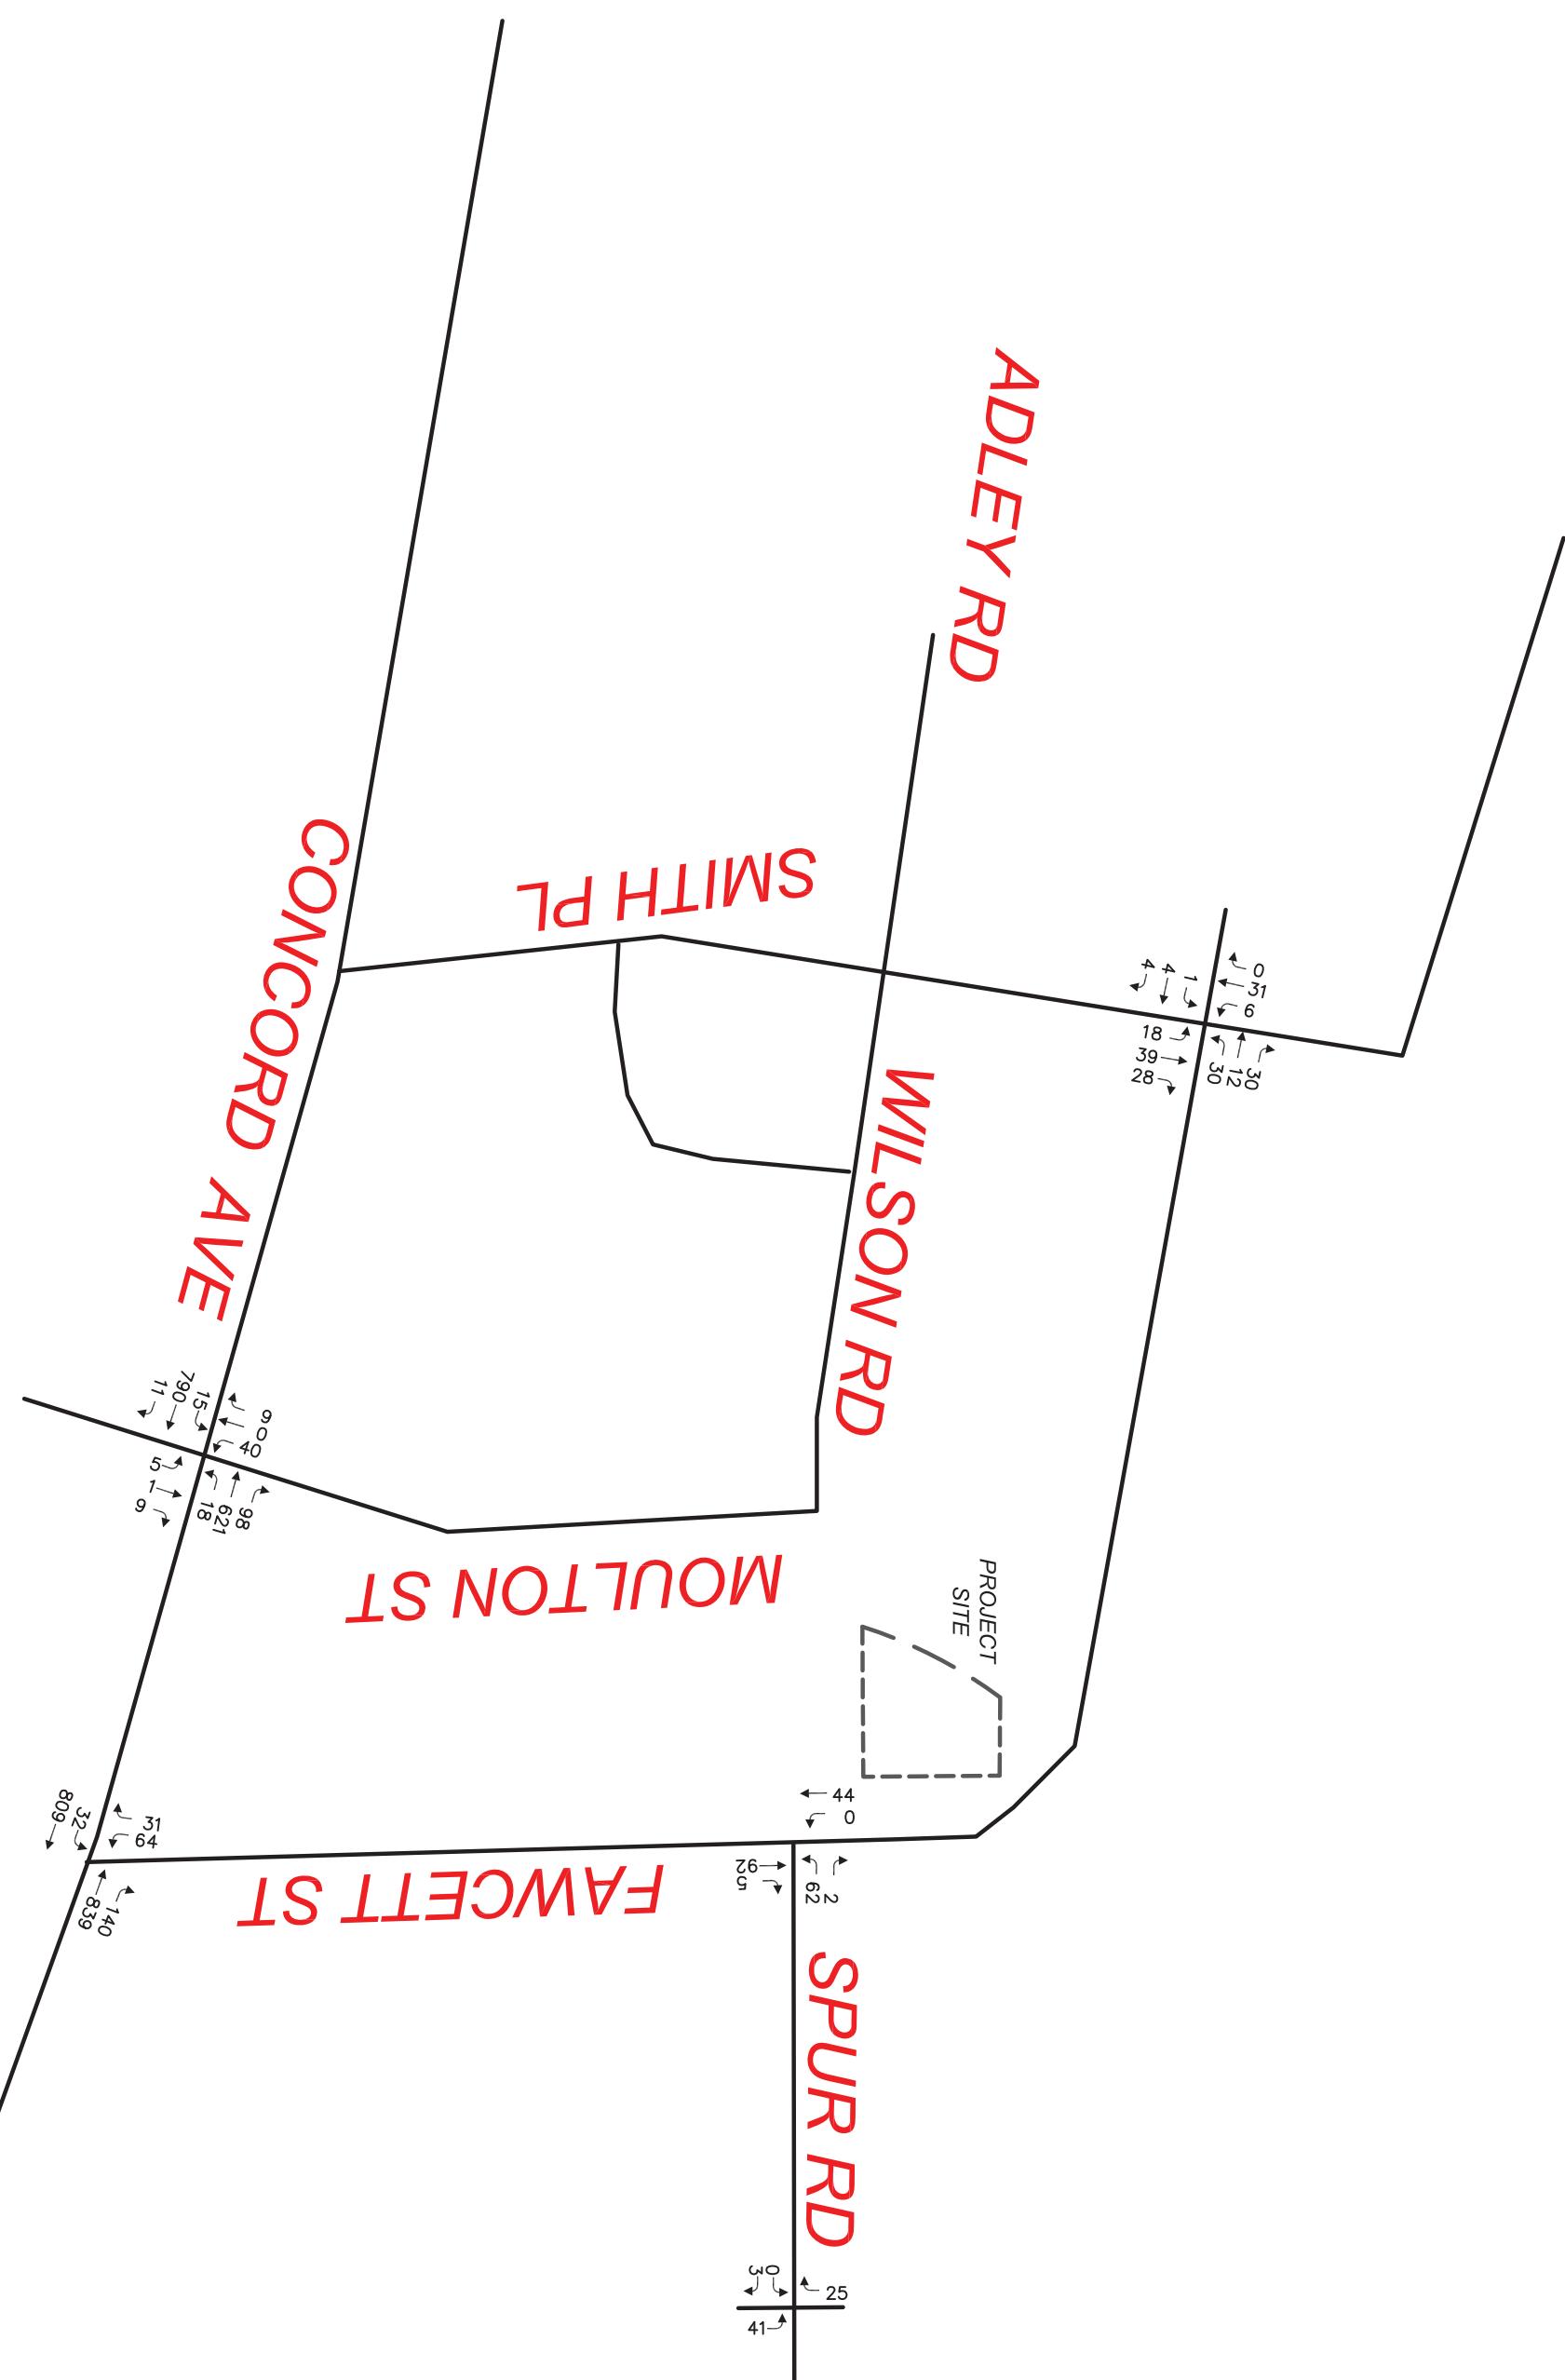

Table 2.f.1: Parking Utilization Study Data

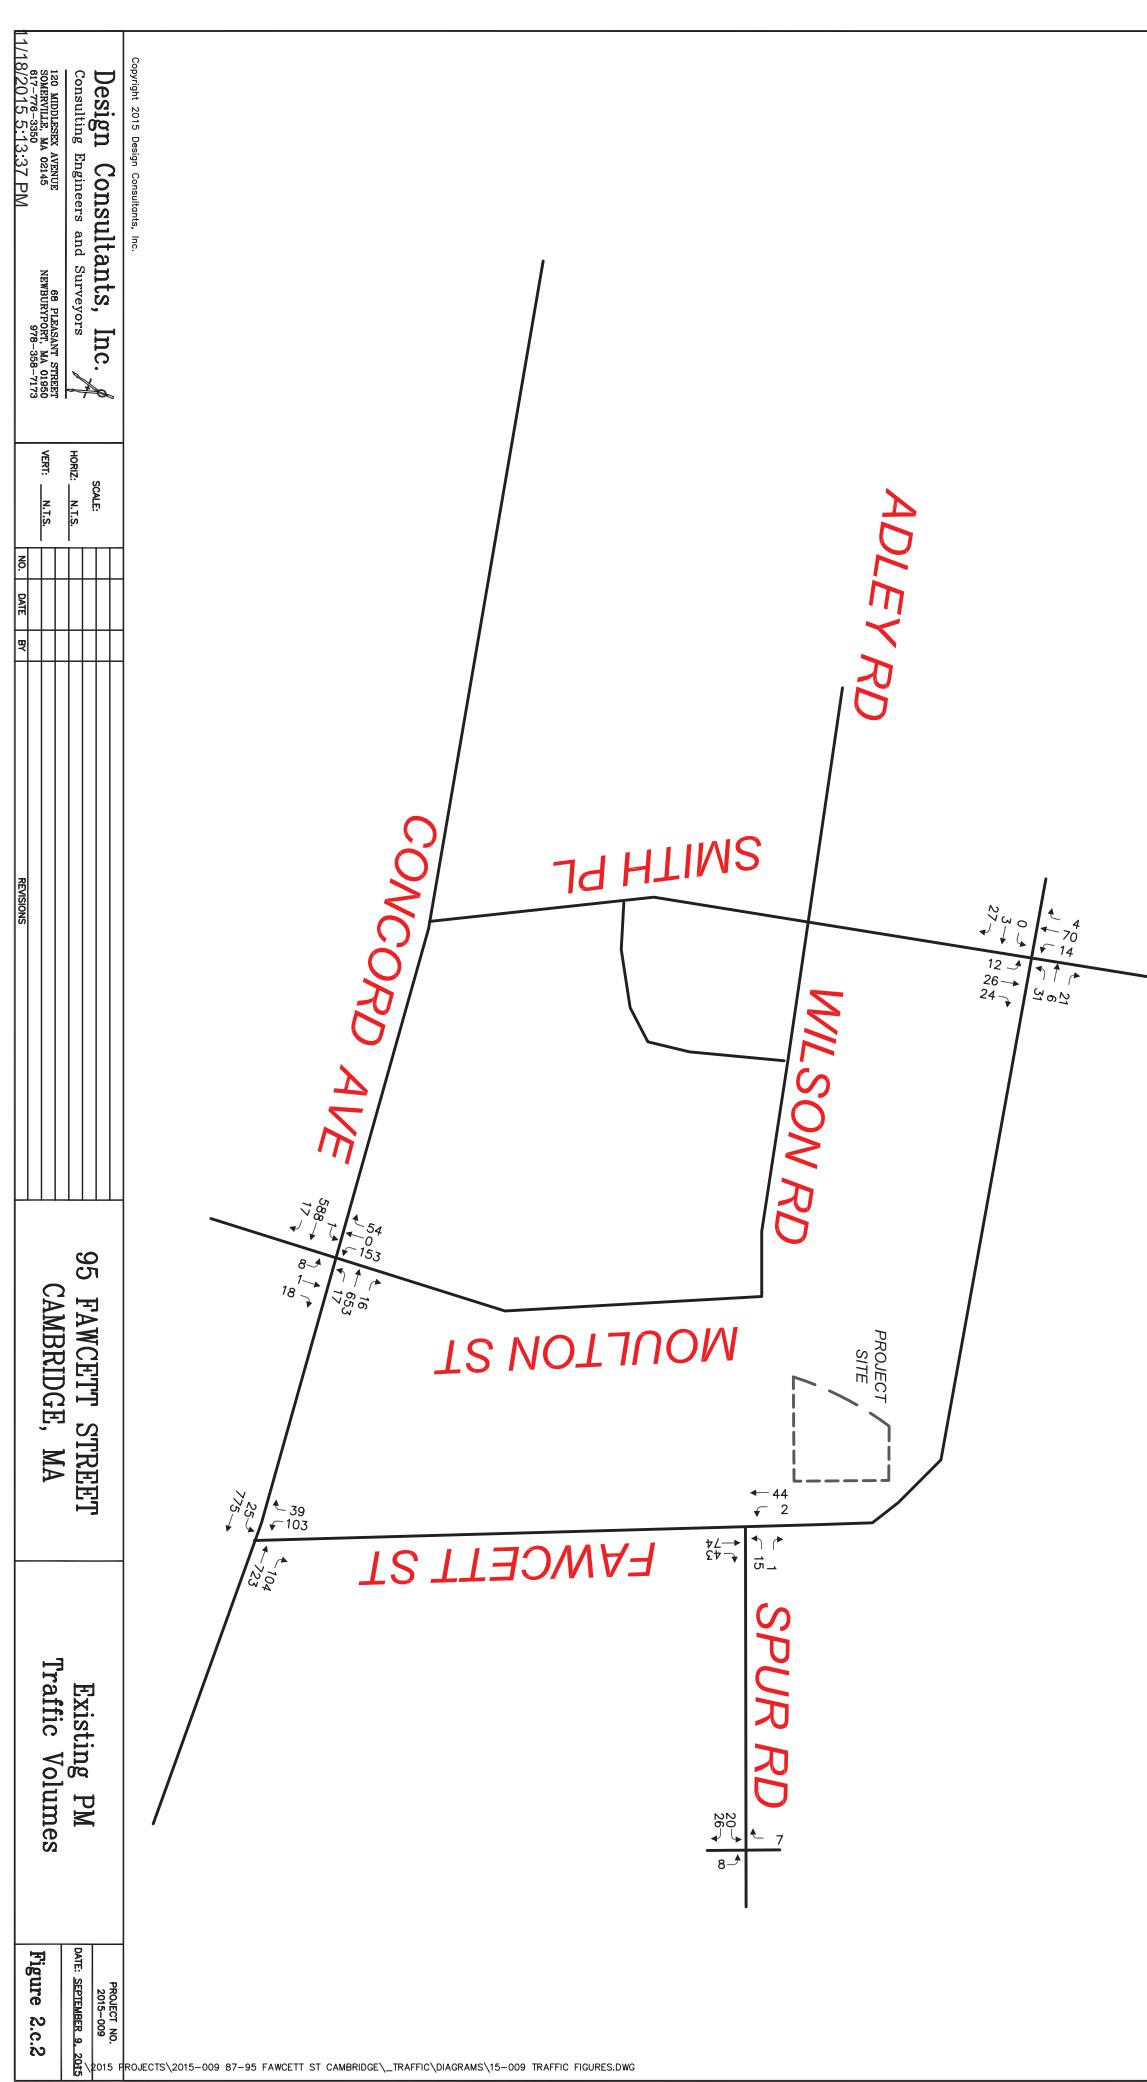

Street	Section		Subsection			1:00PM to 1:30PM	1:30PM to 2:00PM	2:00PM to 2:30PM	2:30PM to 3:00PM	10:00PM to 10:30PM	10:30PM to 11:00PM

3. Project Traffic

a. Preliminary Trip Generation

The base trip generation rates used were taken from The Trip Generation Manual, 9th Edition published by ITE in 2012. Land Use Code (LUC) 220 Apartment was used for this project, for 50 units. Table 3.a.1 summarizes the initial preliminary trip generation calculations.

Table 3.a.1: Preliminary Trip Generation Calculations

95 Fawcett Street, Cambridge, Massachusetts	AM	PM	Weekday Daily
Size (Dwelling Units)	50	50	50
multiply by	0.55	0.67	6.65
Total Trips	28	34	333
Entering%	29%	61%	50%
Exiting%	71%	39%	50%
Entering Trips	8	21	166
Exiting Trips	20	13	167

These trip rates are unadjusted, as they only account for motorized traffic trips. Non-vehicle trips were deducted from the base trips in the following steps.

b. Mode Share and Average Vehicle Occupancy

ITE's Trip Generation methods are typically based on data from suburban developments with no nearby transit service and no appreciable share of people walking or bicycling to or from the site. Commuting characteristics were analyzed from the 2009-2013 American Community Survey 5-Year Estimates. Census Tract 3546, which covers the Project Site, was analyzed and used to estimate mode splits for journeys to work in the project area. Table 3.b.1 displays estimated mode splits for non-vehicle trips.

Table 3.b.1 Mode Split Data for Residents of Census Tract 3546

Census Tract 3546 Mode Split	
Drive Alone + motorcycle =	35.4%
2 person carpool	3.5%
3 person carpool	0.0%
4+ person carpool	0.9%
Public Transit -	30.8%
Bike =	5.5%
Walk =	10.5%
Other Modes =	0.5%
Work at home =	13.5%

Based on the modal split data above and discussions with the City of Cambridge, an Average Vehicle Occupancy (AVO) rate of 1.2 persons per vehicle was utilized. The AVO of 1.2 persons per vehicle was applied to the preliminary trip generation calculations to determine the total number of Person-Trips that are expected to be generated by the project. Then the number of non-vehicle trips was determined by multiplying the person-trips by the percentage expected to utilize transit, bicycling and walking to access the project site. The US Census Tract 3546 was attached in Appendix D.

c. ITE Trip Rates Verification

The ITE trip rates for LUC 220 Apartment are based on sample sizes from variety of units with different sizes, price ranges, and locations. As requested by TP&T, DCI performed peak hour traffic counts at the Atmark Residential Project across the street which has a similar size and in close property to the project site. DCI collected AM and PM peak hour vehicle trips (enter/exit) at the 80/90 Fawcett Street garages. The total number of units at 80-90 Fawcett Street is 428 and DCI coordinated with TP&T and determined that the occupancy for both buildings is 96%. Therefore, a total number of 411 units was used to calculate the observed trip rates coming in and out of the Atmart Residential garage. Table 3.c.1 summarizes the resulting trip generation comparison associated with these observations compared to the ITE-based trip generation with adjusted mode split.

Table 3.c.1 80/90 Fawcett Street Vehicle Trip Generation Comparison with ITE Trip Rates

	80/90 Fawcett Street			ITE Trip Generation use ITE Trip Rate w/ auto mode
	Counts	Trip Rates	use observed Trip Rate	
AM Peak			50 units	50 units
Enter	3	0.01	0.5	0
Exit	66	0.16	8	10
Total	69	0.17	9	10
PM Peak				
Enter	46	0.11	6	9
Exit	15	0.04	2	3
Total	61	0.15	8	12

The observed trip rates are 0.17 vehicle per unit for AM peak period, and 0.15 vehicle per unit for PM peak period. The results are consistent with the city's average trip rates. However, to be conservative, DCI used the ITE trip rates for trip generation and mode splits. The adjusted vehicle-trips and non-vehicle trips are summarized in Table 3.c.2. The detailed trip generation verification is attached in Appendix D.

Table 3.c.2 Trip Generation Summary

	AM	PM	Daily
Total Person Trips	31	37	400
Total Auto Trips	10	12	131
Entering Trips	0	9	65
Exiting Trips	10	3	66
Total Public Transportation Trips	9	11	123
Total Bicycle Trips	2	2	22
Total Walking Trips	3	4	42
Total Work at Home	4	5	54

As indicated in Table 3.c.2, the project will generate 10 vehicle trips during the weekday AM peak period, 12 vehicle-trips during the weekday PM peak period. Transit trips are expected to be 9 trips and 11 trips during the weekday AM and weekday PM peak hours, respectively. Bicycle trips are expected to be 2 trips during both the weekday AM and weekday PM peak hours. Pedestrian trips are expected to be 3 person-trips during the weekday AM and 4 person-trips during the weekday PM peak hours. It is estimated that 4 and 5 people work at home during morning and evening peak hours, respectively. See Figures 3.a.1 and 3.a.2 for AM and PM project generated traffic, respectively.

d. Trip Distribution and Trip Assignment

DCI estimated the trip distribution of project generated traffic from the site into the study area for the year 2020. The estimation is based on Journey-to-Work (JTW) data obtained from the American Community Survey 2006 Census Transportation Planning Package (CTPP). The directional distribution of this project generated traffic is based on existing travel patterns, which were measured over a specific period of time.

Moreover, DCI's experience shows that the standard practice is to employ the same trip distribution and assignment percentages for both inbound and outbound movements, acknowledging that the trip counts are estimates at this time. This technique accounts for nuances in estimating the future numbers. These nuances can include proximity to the transportation and roadway network intricacies. The trip distribution for this project is shown graphically in Figure 3.d.1, and site specific trip assignment is shown in Figure 3.d.2.

4. Background Traffic

DCI reviewed upcoming projects in the area that will have an impact on the surrounding traffic network. The following six projects were included in the development of background traffic volumes.

Location	Developer	Type	Size	Status
Concord Avenue/ Wheeler Street	AbodeZ Development	Mixed-Use	56 residential rental units and 7,000 square feet retail	Under Construction. Project trips have been added to future traffic volume networks.
165 Cambridgepark Drive	Hines, Inc.	Residential	230 units	Under Construction. Project trips have been added to future traffic volume networks.
130 Cambridgepark Drive	BRE/CPD, LLC	Residential	220 units	Under Construction. Project trips have been added to future traffic volume networks.
88 Cambridgepark Drive	BRE/CPD, LLC	Residential	378 units	Under Construction. Project trips have been added to future traffic volume networks.
75 New Street	AbodeZ Development	Residential	93 units	Under Construction. Project trips have been added to future traffic volume networks.
Tyler Green Project	Nordblom Company	Mixed-Use	66 units	Under Construction, previous traffic study does not show specific trips in the 95 Fawcett Street project study area. Assumed that additional traffic is accounted for in the 0.5% annual background growth rate.

The predicted trip volumes associated with each of the six projects were applied to the Future Conditions analysis.

5. Traffic Analysis

Traffic analyses were conducted for the weekday morning peak hour and afternoon peak hour periods for three scenarios: 2015 Existing Conditions, and the 2015 Build Conditions, and 2020 Future Conditions. Each of these scenarios are explained below.

a. Existing Condition

The study intersections were analyzed for 2015 existing traffic conditions during the weekday AM, and weekday PM peak hours. The Existing (2015) Condition analysis is based on existing vehicle and pedestrian counts at the study area intersections as previously presented in Section 2.

b. Build Condition

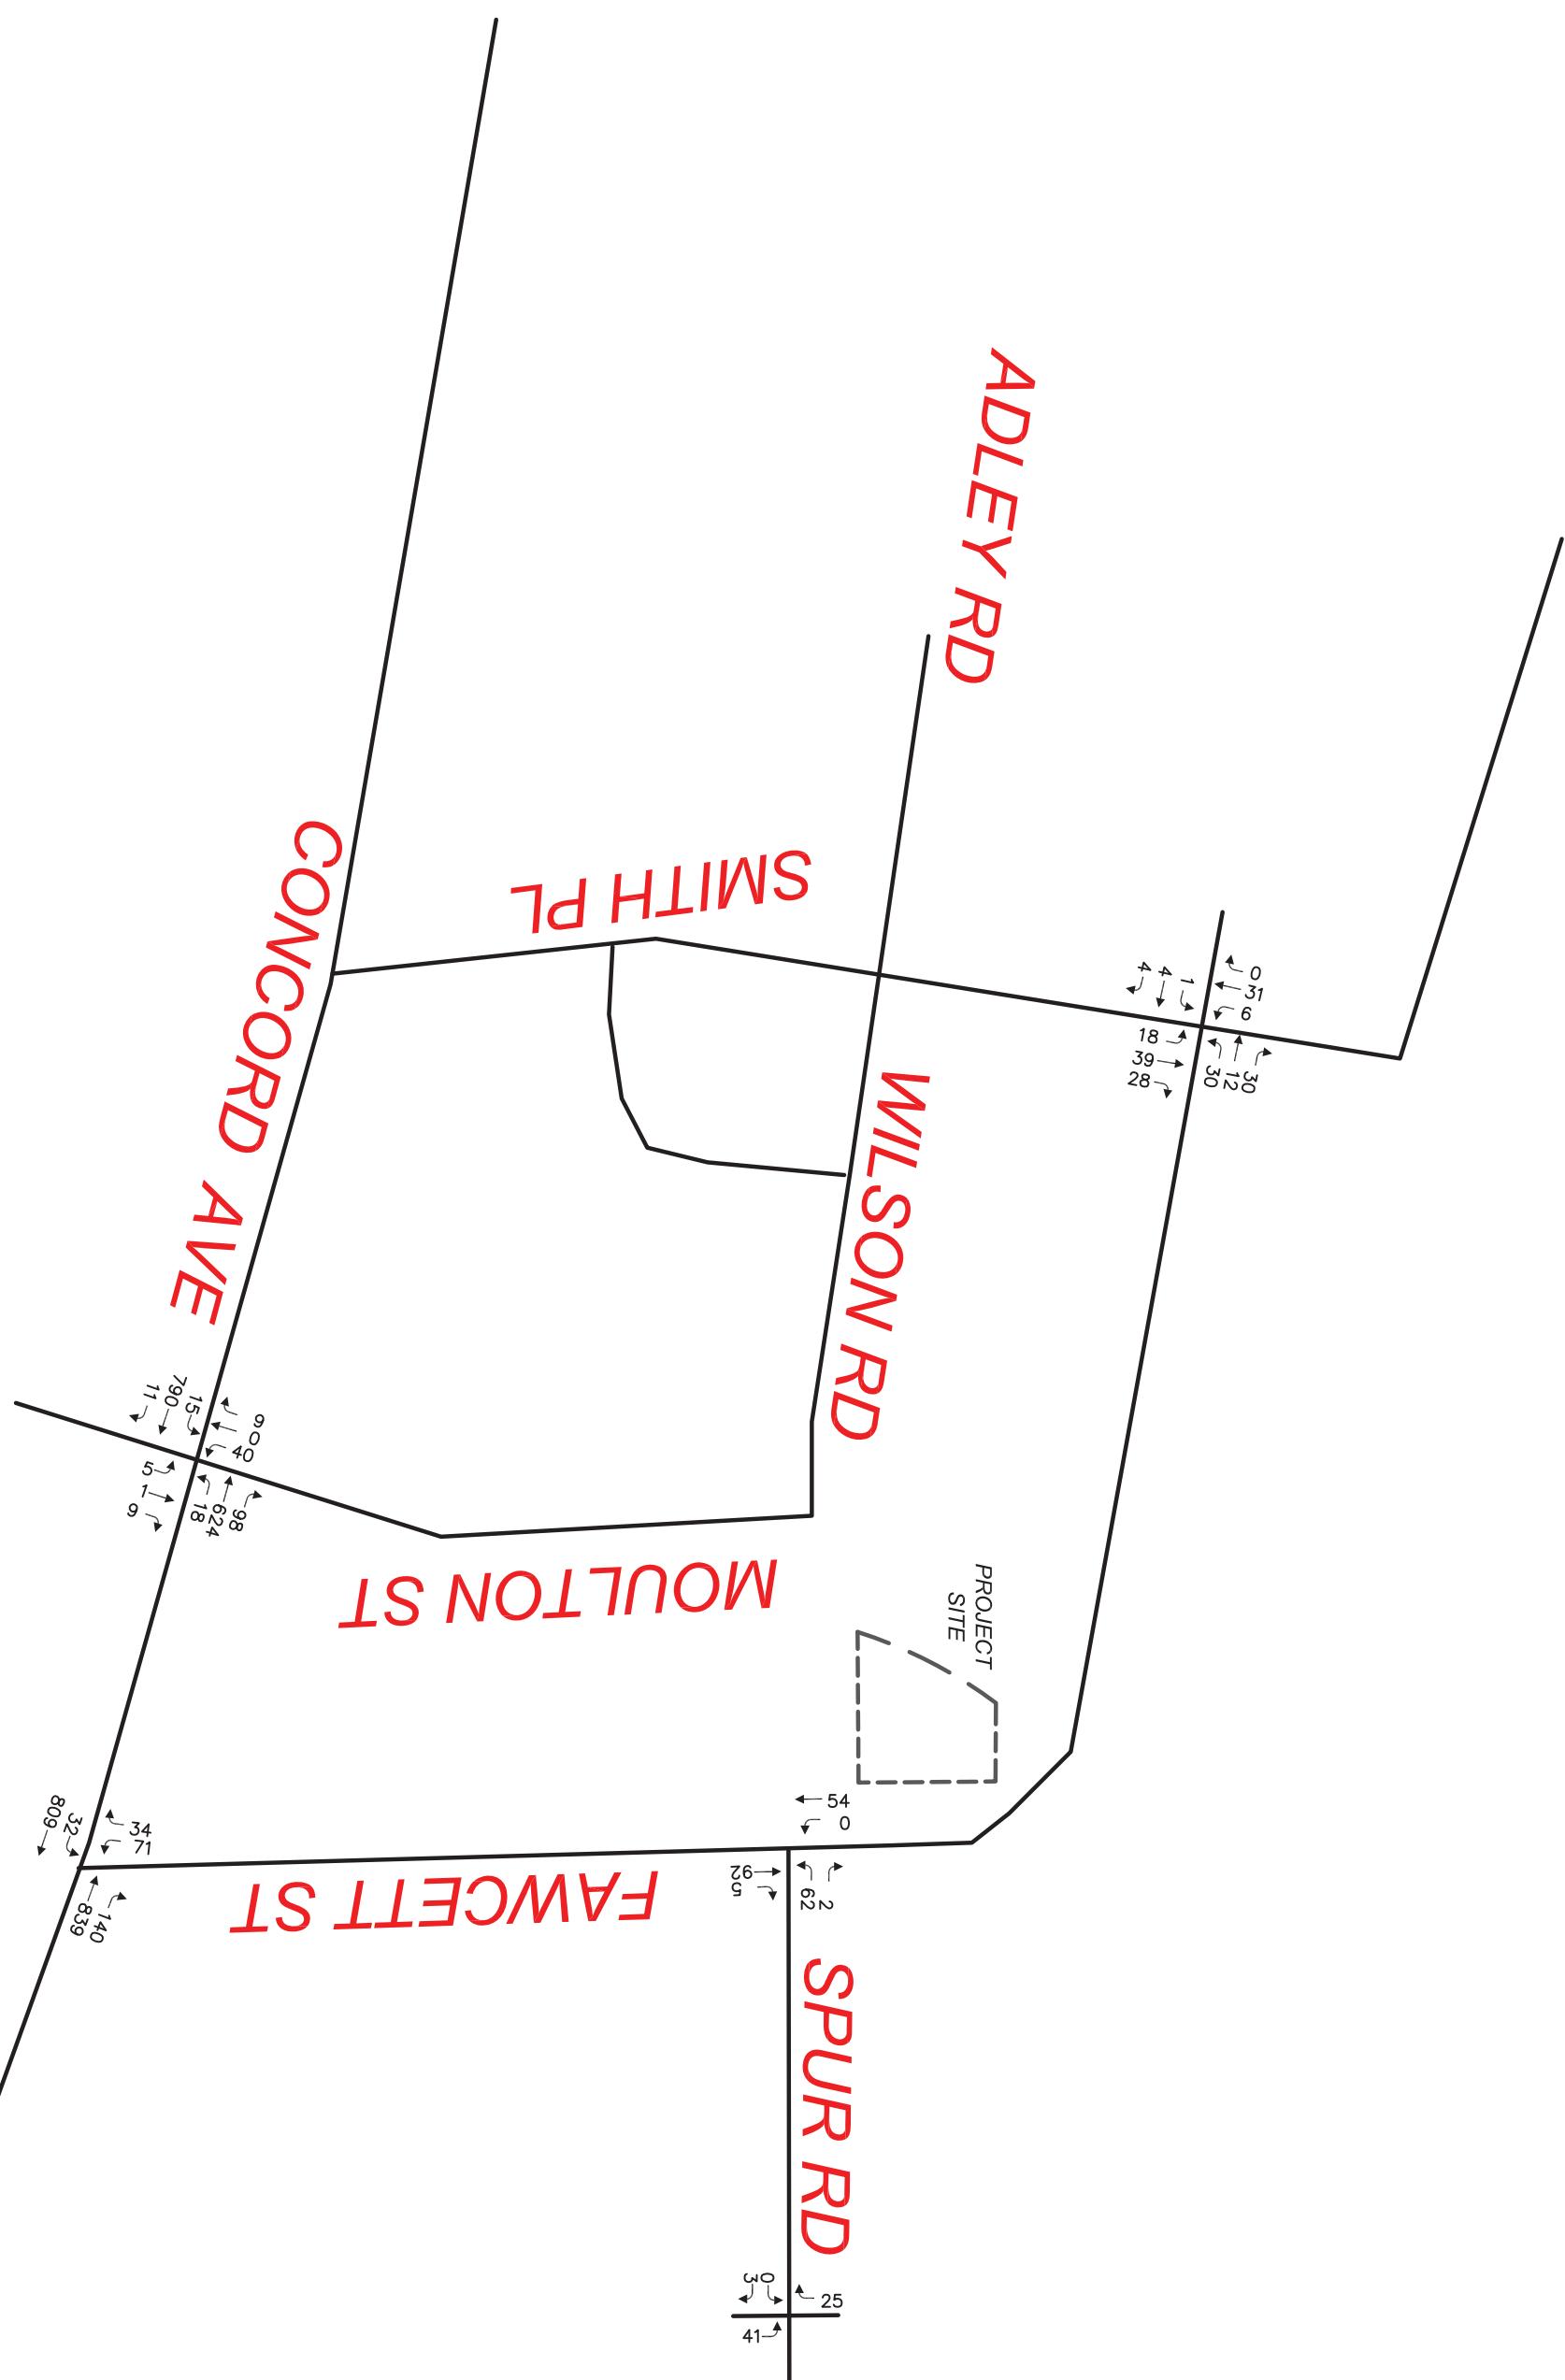

To develop year 2015 Build traffic volumes, the project-generated traffic is added to the existing volumes in the study area. To be conservative, this scenario assumes full occupancy of the 50 unit residential building. The resulting volumes for the 2015 Build Conditions are shown in Figures 5.b.1 and 5.b.2.

c. Future Condition

To develop year 2020 Future traffic volumes, the Build volumes were increased with a growth rate of one-half percent annually for five years. The additional volumes from nearby developments identified in Section 4 were also added into this scenario. The resulting volumes are shown in Figures 5.c.1 and 5.c.2. These volumes were used to carry out the traffic analysis for the 2020 Future Build Condition.

AM Traffic Volumes

Figure 5.b.1

6. Vehicle Capacity Analysis

In this study, intersection performance measures were calculated in the form of volume to capacity (v/c) ratio, average intersection delay, 95th percentile queue lengths, level-of-service (LOS) of overall intersection LOS and the LOS of each approach. Synchro 8.0 was the software used to execute the intersection analysis. Synchro 8.0, a software program from Trafficware, uses the methodologies and thresholds outlined within the Highway Capacity Manual (HCM). This is the preferred and recommended software of MassDOT. Traffic volume represents the travel demand observed and capacity represents the amount of traffic the intersection can accommodate under prevailing conditions. Volume to capacity ratios that approach or exceed 1.0 indicates traffic congestion or poor operating conditions.

Level of Service (LOS) is a term used to denote different operating conditions that occur under various traffic volume loads. It is a qualitative measure of the effect of a number of factors including geometrics, speed, travel delay, freedom to maneuver, and safety. LOS is divided into a range of six letter grades, ranging from A to F, with A being the best and F the worst. LOS F is generally considered inadequate traffic operations in suburban and urban areas. The delay ranges differ slightly between unsignalized and signalized intersections due to driver expectations and behavior for each LOS. Table 6.1 summarizes the LOS criteria.

Table 6.1, Level-Of-Service Criteria for Intersections

LOS	Signalized	Unsignalized
	Control Delay (sec/veh)	Control Delay (sec/veh)
A	0-10	0-10
B	>10-20	> 10-15
C	>20-35	>15-25
D	>35-55	>25-35
E	>55-80	>35-50
F	>80	>50

Source: 2000 Highway Capacity Manual

Results for the Existing (2015), Build (2015), and Future (2020) conditions are presented in Tables 6.2 (AM peak hour) and 6.3 (PM peak hour) for signalized and unsignalized intersections. A summary of the analysis results follows. The detailed Synchro reports are attached in Appendix E.

As indicated in Tables 6.2 and 6.3, the majority of movements at study intersections in the surrounding traffic network operate below capacity and at acceptable levels. Any operational concerns are noted following.

In the Existing Condition, the southbound approach on Fawcett Street to its intersection with Concord Avenue operates with an LOS of F during the AM and PM peak hours. During the AM peak hour, the approach has an average delay of 248.8 seconds per vehicle, and an average delay of 191.4 seconds per vehicle during the PM peak hour. While this approach operates at a low level of service, the intersection as a whole operates at an LOS of B during the AM peak and LOS of C during the PM peak periods.

In the 2015 Build Conditions, the southbound approach on Fawcett Street to its intersection with Concord Avenue continues to operate at an LOS of F during the AM and PM peak hours. The movement experiences an increase in delay of 47.2 seconds per vehicle in the AM peak, and 17.8 seconds per vehicle in the PM peak. The intersection overall drops to an LOS of C during the AM peak hour, and continues to operate at an LOS of C during the PM peak hour.

As shown in the Future Conditions (2020) column, the addition of the project-generated vehicle-trips to the study area results in negligible impacts to the flow of traffic.

7. Queue Analysis

A vehicle queue analysis was conducted at each study intersection in conjunction with the intersection capacity analysis discussed in the previous section. The 50th and 95th percentile queues were used in the analysis. The 50th-percentile queue is defined to be the queue length (in vehicles) that has a 50-percent chance of being exceeded during the analysis time period. The 95th-percentile queue is defined to be the queue length (in vehicles) that has only a 5-percent probability of being exceeded during the analysis time period. It should be noted that the software used for this analysis, Synchro 8, does not generate 50th percentile queues for unsignalized intersections, therefore they are not shown in the results. Tables 7.1 and 7.2 summarize the results of this queue analysis. The maximum field observed queues are shown in the first column.

Table 7.1: Queue Analysis Summary – AM peak

Weekday AM peak hour			Maximum Field Observed Queues (veh)	Existing Conditions (2015)		Build Conditions (2015)		Future Conditions (2020)	
1	Concord Avenue	Moulton Street/Neville Place Driveway		95th % Queue (veh)	50th % Queue (veh)	95th % Queue (veh)	50th % Queue (veh)	95th % Queue (veh)	50th % Queue (veh)
		EB LTR	10	4	3	4	3	4	
		WB LTR	15	11	5	11	5	14	
		NB LTR	2	0	0	0	0	0

3	70 Fawcett Street Driveway	Fawcett Street	SB LR	-	9	-	10	-	12
			WB LR	-	0	-	0	-	0
			NB TR	-	0	-	0	-	0
			SB LT	-	0	-	0	-	0

Table 7.2: Queue Analysis Summary – PM peak

Weekday PM peak hour			Maximum Field Observed Queues	Existing Conditions (2015)		Build Conditions (2015)		Future Conditions (2020)	
				95th % Queue (veh)	50th % Queue (veh)	95th % Queue (veh)	50th % Queue (veh)	95th % Queue (veh)	50th % Queue (veh)
1	Concord Avenue	Moulton Street/Neville Place Driveway	EB LTR	8	4	3	4	3	4
			WB LTR	14	14	7	14	7	17
			NB LTR	3	0	0	0	0	0
			SB LTR	7	1	3	1	3	1
2	Concord Avenue	Fawcett Street	EB LT	-	0	-	0	-	0
			EB T	-	0	-	0	-	0
			WB LTR	-	0	-	0	-	0
			SB LR	-	11	-	11	-	13
3	70 Fawcett Street Driveway	Fawcett Street	WB LR	-	0	-	0	-	0
			NB TR	-	0	-	0	-	0
			SB LT	-	0	-	0	-	0

As indicated in Table 7.1 and 7.2, the addition of project-generated vehicle traffic to the study intersections is expected to result in negligible increases in vehicular queuing.

8. Parking Analysis

As a baseline, parking demand was analyzed based on the ITE Parking Generation manual. For Land Use Code (LUC) 222, High-Rise Apartments (five floors or more), the average peak period parking demand is 1.37 spaces per dwelling unit. The mode split for this area of Cambridge, as shown in Table 3.a.2, indicates that 39.3% of trips would be made by personal motor vehicles (including single-occupancy vehicle trips, carpoolers, and motorcycles). Applying this mode split to the average peak period parking demand yields a rate of 0.54 vehicles per dwelling unit. This is well below the parking demand of one parking space per dwelling units from the City of Cambridge Zoning Ordinance.

Additional research was done to determine average vehicle ownership rates in census tract 3546 (in which the project is located). The most recent vehicle ownership data for residents of census tract 3546 is from the 2011-2013 American Community Survey (ACS) 5-Year Estimates, and are summarized in Table 8.1. The data summarized in Table 9 indicates that 85.3% of all households in census tract 3546 have at least one vehicle.

Table 8.1: Summary of Vehicle Ownership in Census Tract 3546

VEHICLES AVAILABLE	Percent
No Vehicle available	14.70%
1 vehicle available	54.60%
2 vehicles available	20.80%
3 or more vehicles available	10.00%

As indicated in Table 8.2 below, the actual parking demand is expected to be 27 parking spaces and the proposed project will provide 48 parking spaces in a secured ground level and basement level garage. In addition, based on the parking utilization study in section 2.f, there were between 25% to 32% parking spaces available during the weekday period. Consequently, the proposed parking supply is expected to be sufficient to meet the needs of the proposed project.

Table 8.2: Summary of Parking Analysis

Use	Size	ITE Parking Ratio	*Automobile Mode Splits	Parking Demand	Parking Supply
Residential (Apartments)	50 Units	1.37	39.30%	27	48

* Source: 2009-2013 American Community Survey for Census Tract 3546

Moreover, the project site is within walk distance to the Alewife MBTA subway station, which will attract a higher than average number of car-free commuters. Visitor parking is expected to be accommodated with on-street parking, given the results of the on-street parking analysis.

9. Transit Analysis

As indicated in Table 3.a.3, the project is expected to generate 10 new transit trips during the AM peak period and 13 new transit trips during the PM peak period. It is assumed that all transit trips generated by the project will be distributed among the MBTA Red Line, and the MBTA bus route 74 and 78. Table 9 summarize the capacity and usage of bus routes 74 and 78.

Table 9: Transit Analysis

		Max Load		Existing v/c ratio		Additional Build Trips		Build v/c ratio		
Route		Capacity	AM	PM	AM	PM	AM	PM	AM	PM
Route 74	Inbound	53	35	26	0.65	0.49	4	4	0.74	0.56
	Outbound	53	24	40	0.45	0.76	2	4	0.49	0.84
Route 78	Inbound	53	35	26	0.65	0.49	4	4	0.74	0.56
	Outbound	53	24	40	0.45	0.76	2	4	0.49	0.84
Average	Inbound	53	43	22	0.80	0.41	5	3	0.89	0.47
	Outbound	53	23	39	0.43	0.73	2	5	0.47	0.82

As shown in Table 9, the project generated transit trips will not bring bus routes 74 or 78 to, or near capacity during the peak periods. Therefore, it can be stated that the development at 95 Fawcett Street will not have a significant impact on bus route operations or bring existing routes near capacity.

10. Pedestrian Analysis

Pedestrian Yielding Study

The crosswalk to cross Concord Avenue at Fawcett Street has a flashing beacon that is actuated by pushbuttons on either side of the roadway. Given this facility's proximity to the project site, it was deemed necessary to carry out studies to learn more about motorist behavior in the area and how they interact with pedestrians at this intersection. On September 2, 2015 a pedestrian yielding study was carried out at this crosswalk.

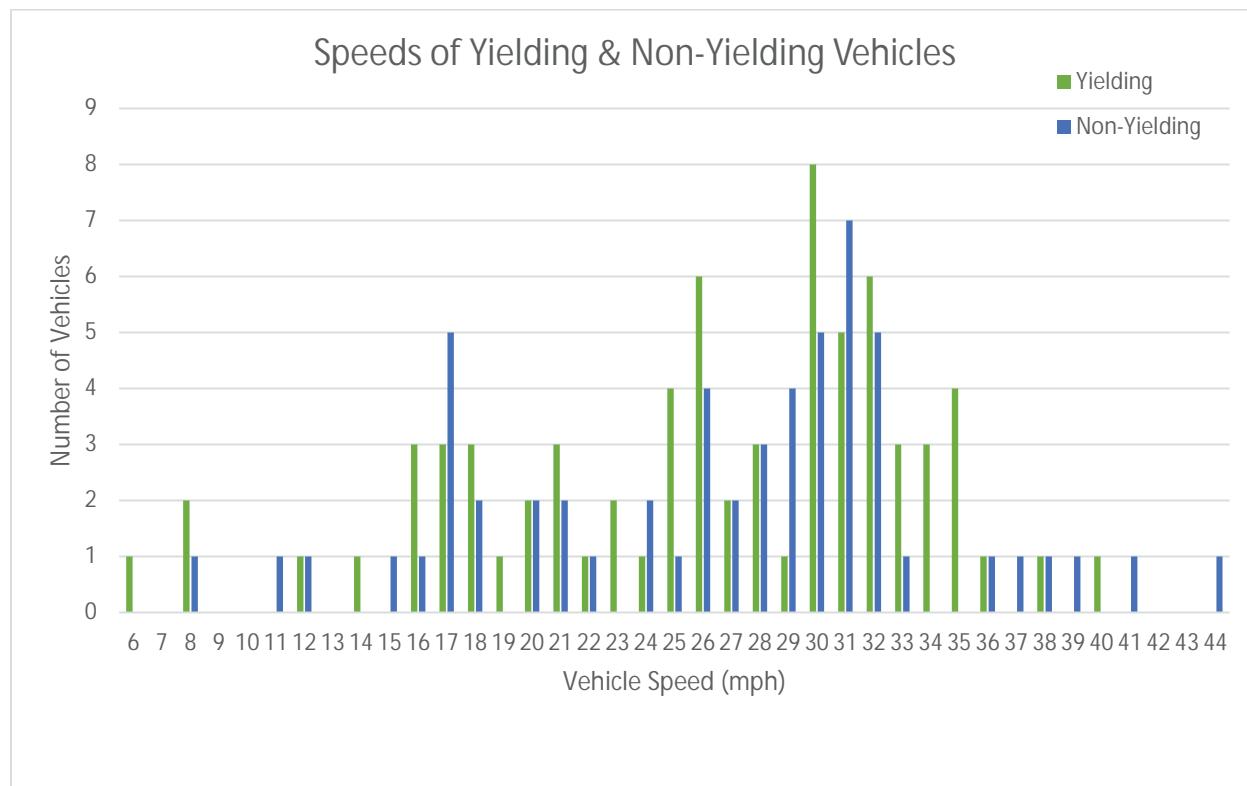

The first step of this study was to determine the dilemma point (D) for each approach. The dilemma point is the maximum distance from the crosswalk from which a driver can comfortably decelerate at a standard rate. The formula for D is shown below,

$$D = Vt + \frac{V^2}{2a}$$

where V is the 50th percentile speed (measured in the field on August 25, 2015), t is the perception/reaction time of 1 second, and a is the AASHTO standard deceleration rate of 11.2 feet/second². Using this formula, dilemma points for each approach were calculated. For the eastbound approach, the dilemma point was 130 feet from the crosswalk. For the westbound approach it was 116 feet from the crosswalk.

As a vehicle approached the dilemma point, the test pedestrian started stepping into the crosswalk. It was noted whether or not the vehicle yielded for the pedestrian, and the vehicles speed was taken. It should be noted that the pedestrian flashing beacon was not actuated during the test crossings for this study. See Figure 10.a below for results of the study.

Figure 10.a: Yielding Analysis Summary

Overall, 56% of vehicles yielded to pedestrians attempting to cross Concord Avenue. The average speed of vehicles that yielded prior to the dilemma point was 29.7 mph, and the average speed of non-yielding vehicles was 31.4 mph. No significant conflicts were observed between pedestrians

attempting to cross Concord Avenue and cyclists. Between 5 and 10 cyclists were observed during the yielding tests and all of them were riding in the cycle track.

Multiple threat behavior at the crosswalk was also studied. “Multiple threat” describes the situation in which a pedestrian is attempting to cross multiple lanes traveling in the same direction, and a vehicle in the lane nearest the curb yields, but adjacent lanes do not. Vehicles in the lane near the curb that yield block sight lines of vehicles in the adjacent lane, causing a “multiple threat” potential safety issue. This situation is only applicable in the westbound direction, as Concord Avenue carries two lanes westbound but only one lane eastbound. Of the 62 crossing attempts for westbound traffic, there were 18 crossings during which the multiple threat was present.

See Table 10.b below for a summary of the yielding study data. See Appendix F complete yielding data.

Table 10.b: Pedestrian Yielding Analysis Summary

		%	Avg. Speed (mph)	Multiple Threat
Eastbound	Yielding	58%	29.7	29%
	Non-Yielding	42%	31.6	
Westbound	Yielding	53%	22.6	N/A
	Non-Yielding	47%	27.7	

Based on this analysis, it is shown that 58% of eastbound vehicles and 53% of westbound vehicles yielded to pedestrians attempted to cross Concord Avenue at Fawcett Street. These numbers are assumed to increase with the use of the existing actuated pedestrian flashing beacon. In the eastbound direction, non-yielding vehicles were traveling about two (2) miles per hour faster than vehicles that yielded. In the westbound direction, non-yielding vehicles were travelling about five (5) miles per hour faster than vehicles that yielded.

11. Bicycle Analysis

Currently, there are no existing bicycle facilities installed on Fawcett Street. Fawcett Street is 30 to 35 feet wide curb-to curb, therefore advisory bike lanes should be considered on Fawcett Street.

According to the City of Cambridge TIS guidelines, intersections with more than 10 bicycles per hour should be analyzed for conflicting bicycle/vehicle movements. The intersection of Concord Avenue with Fawcett Street meets this criteria. Table 11.a. identifies the number of conflicting vehicle movements with these bicyclists. These volumes are summarized for Existing 2015, Build 2015, and Future 2020 conditions.

Table 11.a: Conflicting Bicycle/Vehicle Movements

Location	Bicycle Direction	Existing Peak Hour Bicycle Volume	Conflict Vehicle Movements					
			2015 Existing		2015 Build		2020 Future	
			EBL	WBR	EBL	WBR	EBL	WBR
AM Peak Hour	Eastbound	38	-	140	-	140	-	148
	Westbound	37	32	-	32	-	33	-
PM Peak Hour	Eastbound	31	-	104	-	111	-	116
	Westbound	47	25	-	27	-	28	-

*EBL=Eastbound left, WBR=westbound right

Currently, there are no bicycle parking accommodations on the project site. As shown previously on the project site plan and bicycle parking layout plan, 30 bicycle racks providing 60 long-term bicycle parking spaces will be located in the building. This will be high quality and secure parking versus racks on the sidewalk. As shown in Figure C, the most direct route for bicyclists would be the dedicated exterior door to the outside from the bike storage room and down the ramp to Fawcett Street. Although two other exits from that room go through either the main or side entry lobbies then down to Fawcett Street, only adding one extra vestibule door to pass through before getting to Fawcett Street. Additionally, there is an accessible sloping pedestrian and bicycle pathway as part of the landscape design for the main and secondary building entries. The project will provide both sloping accessible access for ease to both entries, and plaza stairs for quicker access for those wishing to bypass the sloping path. Six short-term bicycle racks will be provided at the south end of the building up against the exterior wall, two short-term bicycle racks will be provided at the exterior wall of the main entry. The eight short-term parking spaces are dedicated for short-term bike users such as visitors.

The Cambridge zoning requires 1 bicycle space per dwelling unit for the first 20 units in a building and 1.05 spaces per unit for additional units. This results in a total of 52 bicycle parking spaces required for the project. The zoning requires 0.1 short-term bike parking space per unit on a lot. This results in a total of 5 short-term bike parking spaces required for the project. In any case, the long term and short-term bicycle parking supply is consistent with the zoning requirements.

12. Signal Warrant Analysis

As requested by the City of Cambridge, a signal warrant analysis was carried out for the intersection of Concord Avenue and Fawcett Street as part of this traffic study. The traffic signal warrant analysis carried out is based on the 2009 Manual on Uniform Traffic Control Devices. The results of this analysis show that a traffic signal should not be considered for this intersection. A summary of the warrants and whether or not they are satisfied is shown below in Table 12.

Table 12: Traffic Signal Analysis Summary

Warrant 1	Eight-hour Vehicular Volume	Yes
Warrant 2	Four-hour Vehicular Volume	No
Warrant 3	Peak Hour	No
Warrant 4	Pedestrian Volume	No
Warrant 5	School Crossing	No
Warrant 6	Coordinated Signal System	No
Warrant 7	Crash Experience	No
Warrant 8	Roadway Network	No
Warrant 9	Intersection Near a Grade Crossing	No

A complete write-up and analysis of each warrant is included in Appendix G. Note that although Warrant 1 is met for traffic signals, it is just barely met. The 85 vehicles just barely pass the threshold of 75 vehicles required to meet the signal warrant. This is close enough where the installation of a signal could be a judgment call by an engineer, though it should be noted that satisfying one of these warrants does not alone necessitate the installation of a traffic signal. It should also be noted that the pedestrian signal at Fawcett Street and Concord Avenue facilitates not only pedestrians but also motor vehicles turning onto Concord Avenue, which may diminish the need for a traffic signal at that intersection.

13. Transportation Demand Management

As part of the development process, the proponent will implement several TDM measures to further minimize vehicular traffic and encourage alternative transportation modes such as walking, biking, or taking public transit. DCI has made the following TDM recommendations:

- Post MBTA bus and subway schedules and maps in common areas of the proposed building to inform tenants about nearby public transit
- Provide tenants with information and maps for nearby bicycle and pedestrian facilities in the area to promote pedestrian and bicycle travel
- To encourage residents to use public transportation, the project proponent could provide a single month's MBTA Charlie Card to each residential unit upon initial occupancy
- Graduated parking rates for multiple cars/spaces to discourage multiple vehicle ownership
- Shuttle service to nearby transit resources (Alewife, commuter rail stations)
- Priority parking spaces for carpools / rideshares
- Assist with the construction of a bike-ped bridge over the railroad tracks to Alewife.
- Consider constructing advisory bike lanes on Fawcett Street.

Planning Board Special Permit Criteria

According to the City of Cambridge TIS Guidelines, Section IV, Guidelines for Presenting Information to the Planning Board, the City of Cambridge uses five criteria for determining certain thresholds of potential adverse impacts. Exceeding one or more of the criteria shall be indicative of a potentially adverse impact on City's transportation network. However, the Planning Board shall consider the mitigation efforts proposed, their anticipated effectiveness, and other supplemental information that identifies a possible reduction in adverse traffic impacts.

Criterion A – Project Vehicle Trip Generation

Criterion A evaluates the number of vehicle-trips generated by proposed projects. Table A-1 below shows the thresholds and anticipated volumes for this project, and determines whether or not this threshold will be met.

Table A-1: Project Vehicle Trip Generation

Time Period	Threshold	Generated Vehicle-Trips	Threshold Exceeded?
Weekday Daily	2,000	131	No
Weekday AM Peak Hour	240	10	No
Weekday PM Peak Hour	240	12	No

As indicated in Table A-1 above, the project is not expected to exceed the criteria for project generated vehicle trips during weekday AM peak hour, weekday PM peak hour, or on a weekday daily basis.

Criterion B – Change in Level of Service at Identified Signalized Intersections

Criterion B evaluates changes in Vehicle Level of Service (VLOS), and limits the project-induced VLOS at signalized intersections. As indicated in the table below, the VLOS at the only signalized study intersection is expected to remain unchanged relative to the existing conditions.

Table B-1: Vehicle Level of Service

East-West Road	North-South Road	Lane	Existing (2015)		Build (2015)		Future (2020)	
			AM	PM	AM	PM	AM	PM
Concord Avenue	Moulton Street/ Neville Place	EB LTR	A	A	A	A	A	A
		WB LTR	A	B	A	B	A	B
		NB LTR	B	B	B	B	B	B
		SB LTR	B	C	B	C	B	C
		Overall	A	B	A	B	A	B

Criterion C – Increased volume of trips on Residential Streets

Criterion C evaluated the traffic impact on residential streets based on two parameters:

1. Amount of Residential, 2. Additional project vehicle trip generation in vehicles per lane for both directions. Table C-1 below illustrates the details of the criterion parameters.

Table C-1: Criterion C parameters

Parameter 1: Amount of Residential	Parameter 2:		
	Current Peak Hour Street Volume (two-way vehicles)		
	<150 Vehicles per Hour (VPH)	150-400 VPH	>400 VPH
1/2 or more	20 VPH	30 VPH	40 VPH
>1/3 but <1/2	30 VPH	45 VPH	60 VPH
1/3 or less	(No max.)	(No max.)	(No max.)

It is noted that Fawcett Street between Concord Avenue and Smith Place is less than 1/3 residential, therefore it falls in the third tier and there is no maximum limit for the increase of peak hour street volume. Consequently, no traffic on Fawcett Street will exceed the criteria.

Criterion D – Increase of length of vehicle queues at identified intersections

This criterion analyzes the change in vehicular queue lengths at study intersections due to project generated traffic. At locations where the existing vehicle queue is under 15 vehicles (which includes all study intersections), the increase in vehicle queuing must remain under 15 vehicles, otherwise not increase by more than 6 vehicles. As indicated in Table D-1 below, this threshold is not exceeded.

Table D-1: Increase in Length of Vehicle Queues

Weekday AM peak hour						
			Existing Conditions (2015)	Build Conditions (2015)	Future Conditions (2020)	Criteria Exceeded?
1	Concord Avenue	Moulton Street/Neville Place Driveway	95th % Q (veh)	95th % Q (veh)	95th % Q (veh)	
			EB LTR	4	4	No

			SB LR	11	11	No
3	70 Fawcett Street Driveway	Fawcett Street	WB LR	0	0	No
			NB TR	0	0	No
			SB LT	0	0	No

Criterion E – Pedestrian & Bicycle Facilities

Criterion E evaluates pedestrian and bicycle facilities to determine if they are sufficient. The first threshold is that pedestrian Level of Service (PLOS) must not change at crosswalks. The second part of criteria evaluates the adequacy of safe pedestrian and bicycle facilities. Table E-1 below summarizes the PLOS according to Criterion E.

a. Pedestrian Level of Service (PLOS)

Table E-1: Pedestrian Level of Service

Weekday AM Peak Hour	Existing Conditions (2015)	Build Conditions (2015)	Future Conditions (2020)	Criteria Exceeded ?
Concord Avenue/Moulton Street	C	C	C	No
Concord Avenue/Fawcett Street west-leg	F	F	F	Yes
Fawcett Street/Spur Road south-leg	A	A	A	No
Weekday PM Peak Hour				
Concord Avenue/Moulton Street	C	C	C	No
Concord Avenue/Fawcett Street west-leg	F	F	F	Yes
Fawcett Street/Spur Road south-leg	A	A	A	No

Based on the methodology from Highway Capacity Manual 2000 Edition, the Pedestrian Level of Service at Concord Avenue and Fawcett Street west leg crossing operates at a LOS F during peak periods, thus triggering the review criteria threshold. The detailed calculation sheet is attached in the Appendix F. However, this is an existing condition that continues into the future condition. Moreover, there is a pedestrian-actuated flashing beacon that facilitates pedestrian movements across Concord Street, which is not reflected in the PLOS. So although in theory the PLOS is F, the reality is that PLOS is effectively much higher due to the beacon facilitating pedestrian movements across Concord Street.

b. Safe Pedestrian Facilities

The project site is well connected to existing pedestrian sidewalks along surrounding streets. Six foot wide concrete sidewalks are provided on the east side of Fawcett Street and 7.7 wide concrete sidewalks are provided on the west side of Fawcett Street. . The crosswalk to cross Concord Avenue at Fawcett Street has a flashing beacon that is actuated by pushbuttons on both sides of the roadway.

c. Safe Bicycle Facilities

Fawcett Street doesn't have bicycle lanes facilities. Advisory bike lanes should be considered for Fawcett Street. It does, however, have low speeds which create a pleasant biking environment. Concord Avenue has a sidewalk-level cycle track on both sides of the street. This cycle track provides connections to mixed use paths in the area. Currently there are no bicycle parking accommodations at the project site. The proposed residential development will include 31 bicycle racks for a total of 62 bicycle parking spaces.

Conclusions

This transportation impact study was prepared to analyze the traffic impact of the 95 Fawcett Street project in Cambridge, Massachusetts. Currently at the site, there is a 20,522 square foot storage warehouse. The project proposes tearing down the existing warehouse and constructing a new five-floor residential building. The new residential building accommodates 50 residential units. On the ground level, the project will provide a secured parking garage with 25 parking spaces and 31 bicycle racks, for a total of 62 bicycle parking spots, as well as a bike repair area. On the basement level, the project will provide a parking garage with 23 parking spaces accessed via a parking elevator.

From a safety perspective, two of the three study intersections experience a crash rate below the MassDOT and District 6 average. While one intersection has a notably high crash rate, it can be shown that this represents only two crashes over three years, and is skewed by extremely low volumes at the intersection. There were no reported injury crashes at that location. The proposed project is not expected to exacerbate any existing safety conditions.

The intersection capacity analyses indicate that the additional vehicle-trips that are expected to be generated by the project site can easily be accommodated by the existing transportation infrastructure, with minimal impacts on traffic operations. This finding is consistent for each analysis period, including the weekday morning peak hour and the weekday afternoon peak hour. Although the signal warrant analysis shows that Warrant 1 is met for traffic signals, it is just barely met. The 85 vehicles just barely pass the threshold of 75 vehicles required to meet the signal warrant. This is close enough where the installation of a signal could be a judgment call by a traffic signal engineer. It should be noted that the pedestrian signal at Fawcett Street and Concord Avenue facilitates not only pedestrians but also motor vehicles turning onto Concord Avenue, which may diminish the need for a traffic signal at that intersection.

None of the 5 special permit criteria laid out by the Planning Board were exceeded with one exception. The Pedestrian Level-of-Service at Concord Avenue and Fawcett Street operates at F during Existing and Build conditions. However, this is an existing condition that continues into the future condition. Moreover, there is a pedestrian-actuated flashing beacon that facilitates pedestrian movements across Concord Street, which is not reflected in the PLOS. So although in theory the PLOS is F, the reality is that PLOS is effectively much higher due to the beacon facilitating pedestrian movements across Concord Street. Also, the project proponent is committed to working with the City of Cambridge to implement appropriate measures to mitigate any adverse impacts that project may generate. Another notable aspect of this section of the study is that there are no bicycle facilities along Fawcett Street. However, there is not enough width curb-to-curb at this time to accommodate standard bike lanes. Advisory bike lanes should be considered for Fawcett Street. A comprehensive Transportation Demand Management (TDM) plan is being proposed to limit the number of vehicle-trips that will be generated by the proposed project. These measures are expected to reduce the already minimal impacts on traffic operations at all study intersections.

- * Available to students through participating middle schools and high schools.

** Available to Medicare cardholders, seniors 65+, and persons with disabilities.

*** For Silver Line SL4 or SL5 pay \$2.65. Also see "transfers."

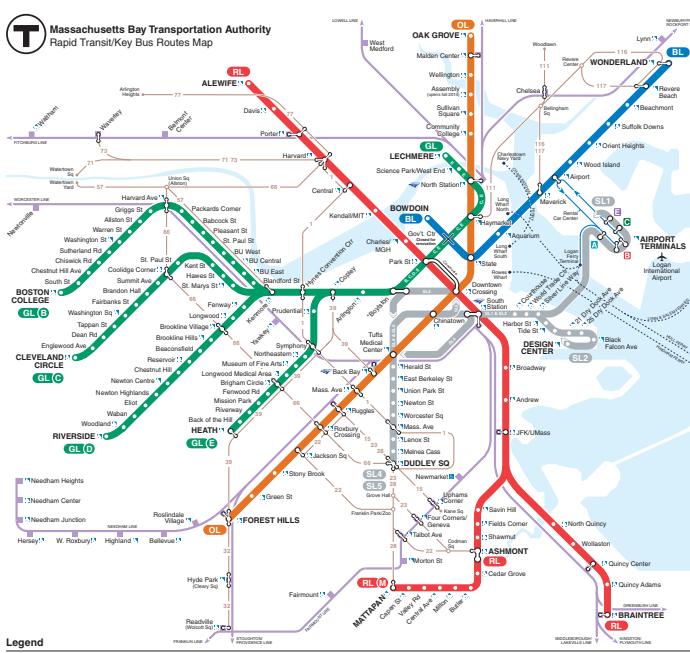

TRANSFERS

If paying with a CharlieTicket or CharlieCard, discounted transfers that are available are automatic — just use the same ticket or card throughout your trip. If paying with cash onboard a vehicle, free transfers are only allowed between rapid transit lines, and in either of the following cases you must ask for a transfer ticket from the operator before paying your fare:

- Boarding Silver Line SL4 or SL5 and transferring to other rapid transit.
- Boarding at a farebox aboard the Green Line or Silver Lines and transferring to Silver Line SL4 or SL5 later in your trip.

Free transfers between the Mattapan High Speed Line and the Red Line at Ashmont.

Schedule Periods (approximate):

AM Rush Hour: 6:30 AM - 9:00 AM
 Midday: 9:00 AM - 3:30 PM
 PM Rush Hour: 3:30 PM - 6:30 PM
 Evening: 6:30 PM - 8:00 PM
 Late Night: 8:00 PM - CLOSE

Government Center:

Due to the closure of Government Center Station, please use Orange Line and Haymarket Station to transfer between Blue and Green Lines. For travel around the Government Center area, walking to/from a nearby station will often be fastest. A shuttle bus (Rt. 608) also operates every 20 minutes from 5:20AM - 1:00AM, starting at Haymarket and serving State, Government Center, and Bowdoin Stations, 7 days a week. Shuttle operates until 2:00AM on Friday/Saturday nights, and begins at 6:00AM on Sundays.

Green Line Notes:

*The first two "C" Line AM inbound trips run through to Lechmere Station on weekdays.

*The first "B" Line and second "C" Line AM inbound trips run through to Lechmere Station on weekends.

*The "D" Line will run to/from North Station off peak, late night and all trips on weekends. Except the last trip on Friday and Saturday will run to/from Park Street Station.

w - Last trips wait at some stations, primarily in the Downtown area, for connecting service. Departure times are approximate.
 * Silver Line - For AM rush 8 minutes and

2009-2013 American Community Survey 5-Year Estimates

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Data and Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities and towns and estimates of housing units for states and counties.

Subject	Census Tract 3546, Middlesex County, Massachusetts				
	Total		Male		Female

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

The 12 selected states are Connecticut, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and Wisconsin.

Workers include members of the Armed Forces and civilians who were at work last week.

While the 2009-2013 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural population, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Source: U.S. Census Bureau, 2009-2013 5-Year American Community Survey

Explanation of Symbols:

1. An '***' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
2. An 'L' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
3. An 'L' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
4. An 'U' following a median estimate means the median falls in the upper interval of an open-ended distribution.
5. An '****' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
6. An '*****' entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.
8. An '(X)' means that the estimate is not applicable or not available.

APPENDIX F – PEDESTRIAN DELAY ANALYSIS

Design Consultants
 October 8, 2015
 Pedestrian Delay Calculations
 2000 Highway Capacity Analysis

Unsignalized Intersections

Critical gap for a single pedestrian

$$\text{Equ. 18-17} \quad t_c = (L / S_p) + t_s$$

Assume no pedestrian platooning, therefore $t_c = t_G$

Average Delay to Wait for an Adequate Gap

$$\text{Equ. 18-21} \quad d_g = (1 / v) * (e^{(v*t_G)} - (v*t_G) - 1)$$

APPENDIX G – SIGNAL WARRANT ANALYSIS

Traffic Signal Warrant Analysis for the Intersection of Concord Avenue and Fawcett Street

Warrant 1, Eight-hour Vehicular Volume

Condition A for Warrant 1 calls for the vehicles per hour given in both of the 100% columns of Condition A in Table 4C-1 to exist on the major-street and the higher-volume minor-street approach. Condition B calls for the vehicles per hour given in both of the 100 percent columns of Condition B in Table 4C-1 to exist on the major-street and the higher-volume minor-street approach. The intersection of Concord Avenue and Fawcett Street does not meet Condition A for Warrant 1, but it does meet Condition B. Only one of these conditions need to be met to satisfy this warrant. See Table 4C-1 below for required volumes.

Table 4C-1. Warrant 1, Eight-Hour Vehicular Volume

Condition A—Minimum Vehicular Volume

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% ^a	80% ^b	70% ^c	56% ^d	100% ^a	80% ^b	70% ^c	56% ^d
1	1	500	400	350	280	150	120	105	84
2 or more	1	600	480	420	336	150	120	105	84
2 or more	2 or more	600	480	420	336	200	160	140	112
1	2 or more	500	400	350	280	200	160	140	112

Condition B—Interruption of Continuous Traffic

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% ^a	80% ^b	70% ^c	56% ^d	100% ^a	80% ^b	70% ^c	56% ^d
1	1	750	600	525	420	75	60	53	42
2 or more	1	900	720	630	504	75	60	53	42
2 or more	2 or more	900	720	630	504	100	80	70	56
1	2 or more	750	600	525	420	100	80	70	56

^a Basic minimum hourly volume

^b Used for combination of Conditions A and B after adequate trial of other remedial measures

^c May be used when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000

^d May be used for combination of Conditions A and B after adequate trial of other remedial measures when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000

MUTCD, 2009 ed., Section 4C.02, Table 4C-1

The ATR data used to satisfy Condition B is shown in the table below. Note that complete ATR data is included in Appendix A.

Eight-Hour Vehicular Volume		
Condition A + B	Concord Ave	Fawcett St
7:00am - 3:00pm	1412 vph	85 vph

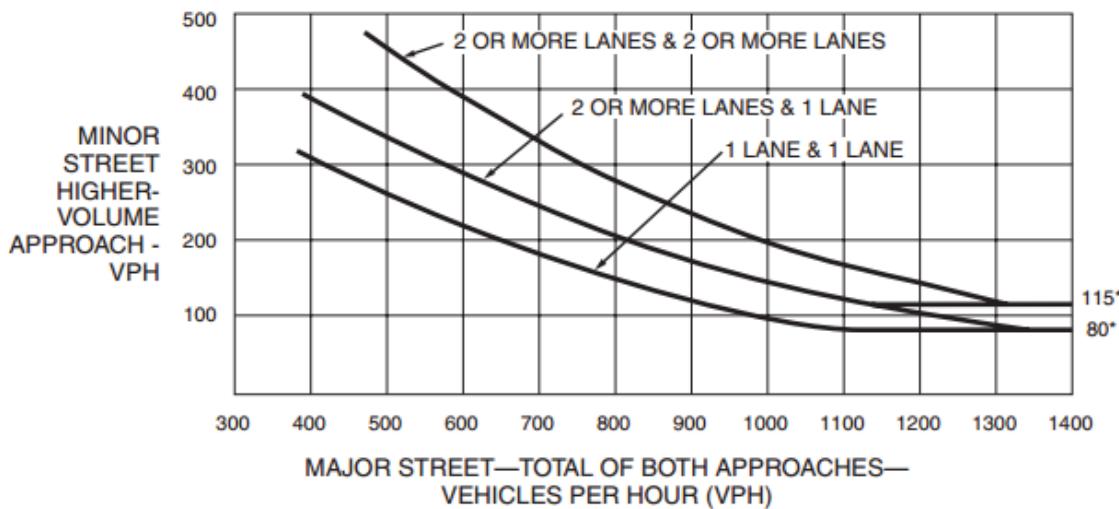

Warrant 2, Four-hour Vehicular Volume

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 2.

Warrant 2 defines thresholds for traffic volumes in terms of vehicles per hour, based on any four hours of data from an average day. To fulfill the condition, the points plotted on Figure 4C-1 (see below)

representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the minor street must fall above the applicable curve. The threshold volume for the minor street approach is 80 vehicles per hour. The intersection of Concord Avenue and Fawcett Street does not satisfy this warrant, because there were volumes on Fawcett Street that do not meet this lower threshold.

Figure 4C-1. Warrant 2, Four-Hour Vehicular Volume

*Note: 115 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 80 vph applies as the lower threshold volume for a minor-street approach with one lane.

MUTCD, 2009 ed., Section 4C.04, Figure 4C-1

Warrant 3, Peak Hour

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 3.

The standard for this warrant states that it “shall only be applied in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.” The intersection of Concord Avenue and Fawcett Street does not fit this description, therefore the warrant is not satisfied.

Warrant 4, Pedestrian Volume

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 4.

The minimum threshold value for pedestrians crossing the intersection per hour is 107. During September 2015, pedestrian counts were carried out at the study intersection, where a maximum of 49 pedestrians in an hour were observed traversing the intersection. This volume does not meet minimum values, therefore the warrant is not satisfied.

Warrant 5, School Crossing

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 5.

Warrant 5 is for use at intersections where the fact that schoolchildren cross the major street is the principal reason to install a traffic signal. The lower threshold for this warrant is 20 school children crossing the roadway in the highest crossing hour. This threshold was not met, therefore the warrant is not satisfied.

Warrant 6, Coordinated Signal System

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 6.

Warrant 6 is for intersections that fall between two coordinated signals. The following criteria for this warrant are laid out by the MUTCD.

The need for a traffic control signal shall be considered if an engineering study finds that one of the following criteria is met:

- A. **On a one-way street or a street that has traffic predominantly in one direction, the adjacent traffic control signals are so far apart that they do not provide the necessary degree of vehicular platooning.**
- B. **On a two-way street, adjacent traffic control signals do not provide the necessary degree of platooning and the proposed and adjacent traffic control signals will collectively provide a progressive operation.**

MUTCD, 2009 ed., Section 4C.07, Paragraph 02

Neither of these conditions are applicable at the intersection of Concord Avenue and Fawcett Street, therefore the warrant is not satisfied.

Warrant 7, Crash Experience

The intersection of Concord Avenue and Fawcett Street does not meet the conditions for Warrant 7.

There are three conditions that must be met for Warrant 7. Condition A states that adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce crash frequency. Condition B is that five or more reported crashes have occurred within a 12-month period, each involving personal injury or property damage. After reviewing the most recent three years of crash data from MassDOT, there has not been a 12-month period with five or more crashes. Condition C is that vehicular volumes meet the 80% columns in Table 4C-1, shown above. Condition C is not met by the volumes at this intersection, Warrant 7 is not met because not all Conditions are fulfilled.

Warrant 8, Roadway Network

The intersection of Concord Avenue and Fawcett Street does not meet the criteria for Warrant 8.

Warrant 8 is meant for an intersection that is part of a roadway network that would benefit operationally from a traffic control signal. While examining the network, this intersection does not fit this warrant, and it also does not meet the standards described. The MUTCD lays out three characteristics for the major route in this case, at least one of which would have to apply to Concord Avenue. They are shown below.

A major route as used in this signal warrant shall have at least one of the following characteristics:

- A. It is part of the street or highway system that serves as the principal roadway network for through traffic flow.**
- B. It includes rural or suburban highways outside, entering, or traversing a city.**
- C. It appears as a major route on an official plan, such as a major street plan in an urban area traffic and transportation study.**

Concord Avenue does not match any of these characteristics, therefore the warrant is not satisfied.

Warrant 9, Intersection Near a Grade Crossing

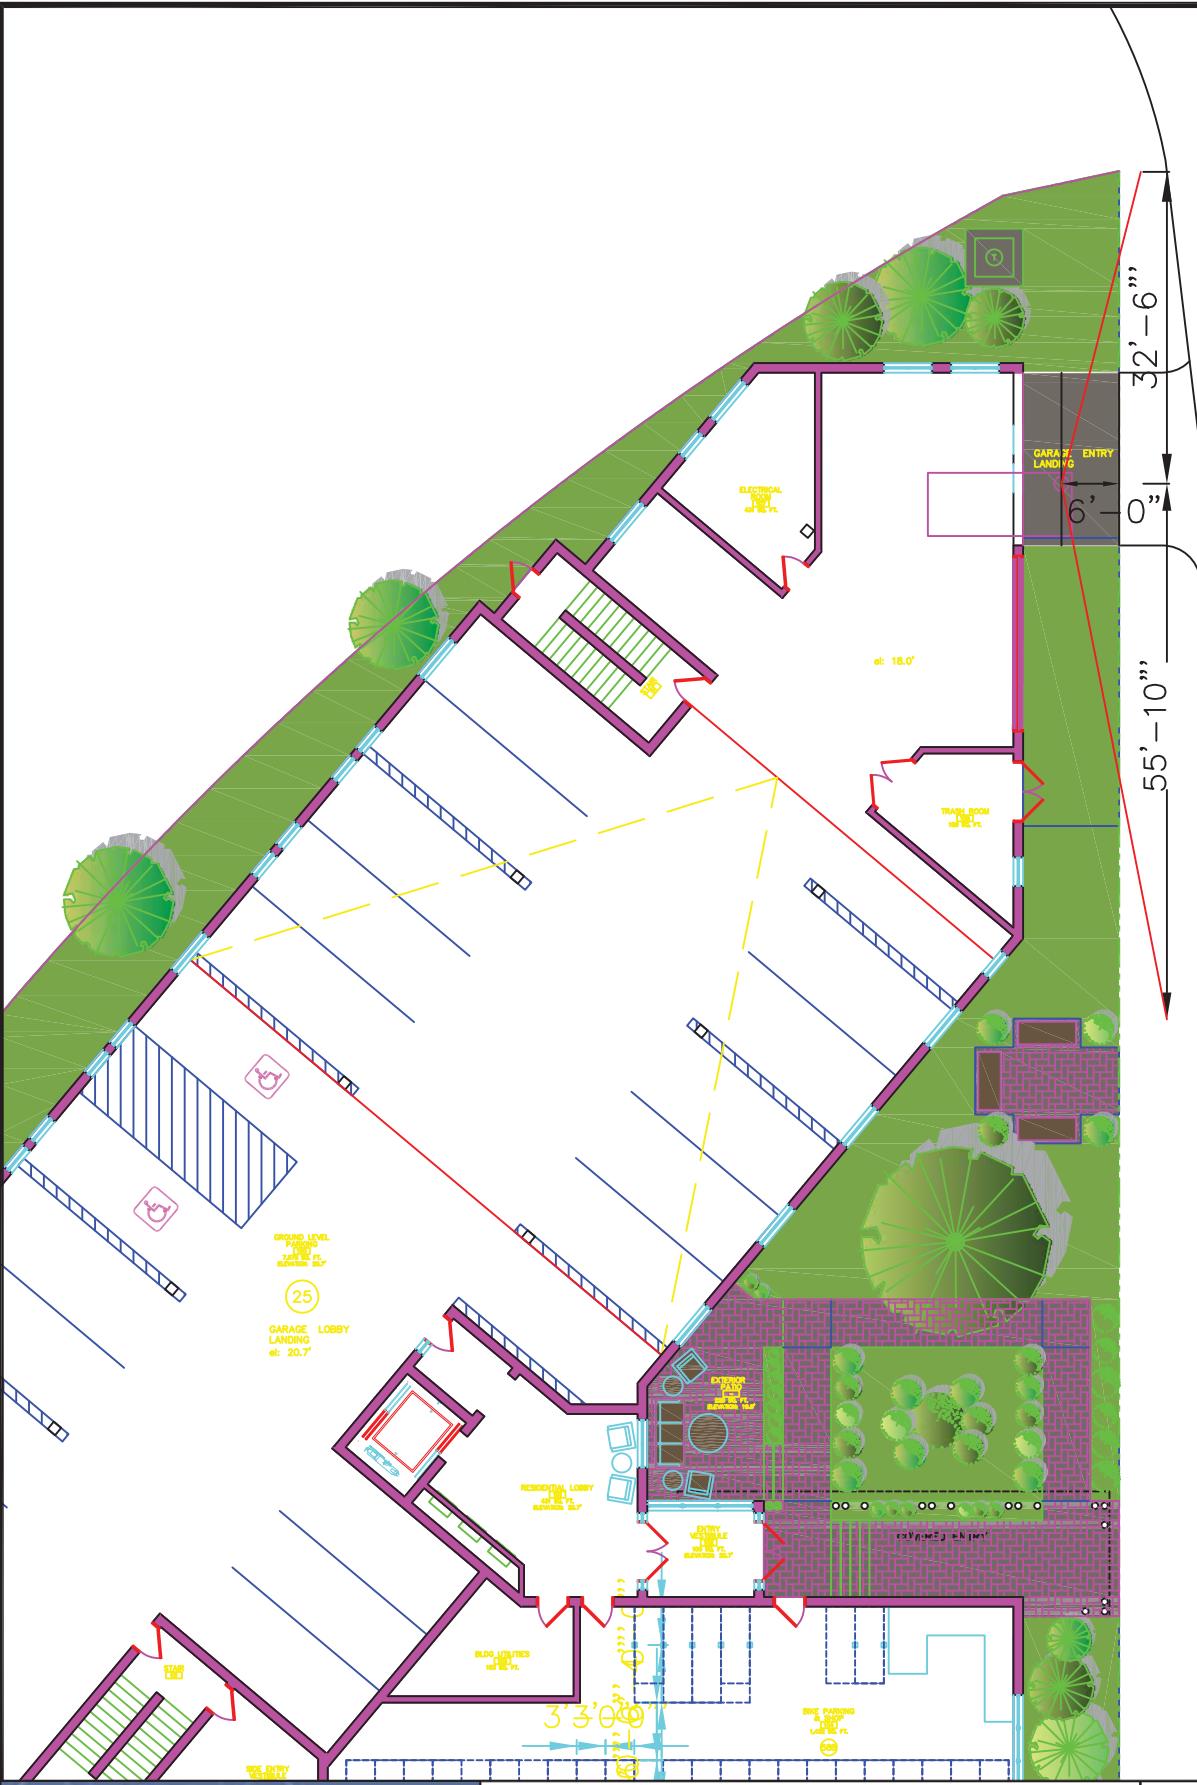

The intersection of Concord Avenue and Fawcett Street does not meet the criteria for Warrant 9.

In order to fulfill the conditions for Warrant 9, a grade crossing must exist on an approach that is STOP or YIELD controlled (Fawcett Street) within 140 feet of the stop or yield line. This is not the case for this intersection, therefore the warrant is not satisfied.
