Kate-a few comments about the recent meeting. I went to the soil management group with CDM and the contractor. They indicated that Fuss and O'Neil is part of the team. What exactly is their role?

As the entire site is an old clay pit filled with a variety of materials beneath a thin fill layer, my comments pertain to all three alternatives. I would like to learn more about how the structures will be protected from methane gas, and volatile organic compounds. Also the soil management procedures need to be fully fleshed out including how asbestos contaminated soil will be managed. Will the City Ordinance concerning managing Soil on asbestos contaminated sites be waived for this project?

Results of soil precharacterization for excavated materials need to be shared, as well as the plans for routing the trucks for loading and the routes for driving thru the neighborhood. There will be many trucks involved in this process. I understand that details may not yet be available, but they are very important.

Thank you.
